## **Chapter 1 - Setup**

### Introduction

Thank you for purchasing a Buffalo AirStation. The WZR-900DHP and WZR-600DHP2 AirStations are dual-band wireless routers with outstanding performance and range. They combine high data transfer speeds with a robust set of extra features like QoS, USB NAS, media server, and web filtering. This manual will help you set up and use your new wireless router. If you're new to wireless networking, turn to chapter 2 to start configuring your wireless network.

For advanced users, use a wired Ethernet connection to access the AirStation's settings:

- Default LAN-side IP address: 192.168.11.1
- Username: admin
- Default password: password

### **Diagrams and Layout**

#### 1 AOSS button

To initiate AOSS, hold down this button until the wireless LED flashes (about 1 second). Then, push or click the AOSS button on your wireless client device to complete the connection. Both devices must be powered on.

2 Power/Diag LED (Green or Red)

On (Green): Power is on. On (Red): The AirStation is in wireless bridge mode. Blinking (Green): Booting. Off: Power is off. 2 blinks (Red)\*\*: Flash ROM error. 3 blinks (Red)\*\*: Wired LAN error. 4 blinks (Red)\*\*: Wireless LAN error. 5 blinks (Red)\*\*\*: IP address setting error. Continuously blinking\*: Updating firmware, saving settings, or initializing settings.

\* Do not unplug the AC adapter while the LED is blinking continuously.

\*\* Turn off AirStation first, wait for a few seconds, then turn it back on.

\*\*\* WAN-side and LAN-side IP addresses are the same. Change the LAN-side IP address of the AirStation.

Wireless LED (Green or Amber)
On: Wireless LAN is enabled or transmitting.
Double blinks: AirStation is waiting for an AOSS or WPS security key.
Continuously blinking (fast): AOSS/WPS error; failed to exchange security keys.
Continuously blinking (slow): The AirStation is in wireless bridge mode.
Off: Wireless LAN is disabled.
Note: The wireless LED will be green if security is enabled or amber if it is disabled.

 Internet Access LED (Green)
 On: The WAN port is connected.
 Off: No Internet access.

 Router LED (Green or Amber)
 On (Green): Router functionality is enabled.
 Off: Router functionality is disabled.

### **Back Panel**

### 1 Mode Button

This button switches between router mode, access point mode, and wireless bridge mode.

#### 2 Setup Card Slot

This is the slot where the AirStation setup card is stored. The initial settings for the username, password, SSID, and encryption type are provided on the card for logging in to Settings.

### **3** USB Eject Button

To dismount a USB hard drive, hold down this button until the USB LED flashes (about 3 seconds). The USB drive can then be unplugged safely.

4 USB LED (Green)

On: A USB drive is connected. Fast blinking: The USB drive is transmitting data. **Blinking:** The USB drive has been dismounted and can safely be unplugged. Off: No USB drive is connected.

Note: Do not remove the USB drive or turn off the AirStation while data is being transmitted.

5 USB Port

You can connect a USB drive.

#### Notes:

- WZR-900DHP has an USB 3.0 port and WZR-600DHP2 has an USB 2.0 port.
- USB 3.0 hubs are not supported. Use USB 2.0 hubs only.

**6** LAN LED (Green)

On: An Ethernet device is connected. Blinkina:

An Ethernet device is communicating.

7 LAN Port

Connect your computer, hub, or other Ethernet devices to these ports. This switching hub supports 10 Mbps, 100 Mbps, and 1000 Mbps connections.

8 Internet LED (Green) On: The Internet port is connected. **Blinking:** The Internet port is transmitting data.

9 Internet Port

10 Mbps, 100 Mbps, and 1000 Mbps connections are supported.

Note: In bridge mode, the Internet port becomes a regular LAN port, for a total of 5 usable LAN ports.

#### **10** Power Button

This button turns the power on and off.

**11** DC Connector

Connect the included AC adapter here.

### **Bottom**

1 Reset Button

To reset all settings, hold down this button until the power/diag LED turns red (about 3 seconds). The power must be on for this to work.

### Installation

### **Vertical Placement**

Attach the stand as shown in the figure below.

### How to Set Up AirStation for the First Time

### **Connect to a PC and Power On**

To configure your AirStation, follow the procedure below.

- 1 Verify that you can connect to the Internet without the AirStation, then turn off your modem and computer.
- 2 Unplug the LAN cable which connects your computer and modem.

**3** Plug one end of the LAN cable into your modem and the other end to the AirStation's Internet (WAN) port. Turn on the modem.

**4** Turn on the AirStation and wait one minute.

**Note:** If the power does not turn on when the AC adapter is connected, press the power button on the rear of the AirStation.

**5** If using a wired LAN, connect the AirStation LAN port and computer using a LAN cable. If using a wireless LAN, connect the computer to the wireless LAN as described in Chapter 3.

 Once your computer has booted, the AirStation's LEDs should be lit as described below: Power/Diag: Lit green.
 Wireless: Lit green.
 Internet access: Lit green.
 Router: Lit green.
 LAN: Lit or blinking green.
 Internet: Lit or blinking green.

Note: If the router LED is not lit, hold down the mode button for about 3 seconds to switch to router mode.

7 Launch a web browser. If the home screen is displayed, setup is complete. If username and password fields are displayed, enter "admin" for the username and "password" for the password, then click *Log In*. Step through the wizard to complete setup.

You've completed the initial setup of your AirStation.

### **Opening Settings**

To configure the AirStation, log in to Settings as shown below.

1 Launch a web browser.

2

Enter the AirStation's LAN-side IP address in the address field and press the enter key.

#### Notes:

- The AirStation's default LAN-side IP address depends on the mode.
- In router mode: 192.168.11.1
- In access point mode: 192.168.11.100
- In wireless bridge mode: 192.168.11.100
- If you changed the IP address of the AirStation, then use the new IP address.

**3** Enter "admin" for the username and "password" for the password, then click *Log In*.

Log In

**Note:** If you forget your password, hold down the reset button to initialize all settings. Note that all other settings will also revert to their default values.

**4** This is the home page of Settings, where most AirStation settings can be configured.

### **Connect Your Wireless Devices**

For each wireless device that you want to connect to the network, use the device's built-in software to search for available networks. Find your SSID (the name of your wireless network) on the list of detected networks and select it.

Not connected	* <del>*</del>
Connections are available	E

Open Network and Sharin	g Center

Enter the passphrase for the network and you'll be connected. Repeat for any additional wireless client devices that you want to connect.

## **Chapter 2 - Settings**

Settings is the configuration GUI for the AirStation. You can configure all settings for the AirStation from here. This user manual shows examples from the WZR-900DHP. If you have a WZR-600DHP2, your screens may be slightly different.

### **Easy Admin**

### <u>Home</u>

When you first open Settings, the Easy Admin page is shown. From this page you can easily configure common settings. The examples below assume the AirStation is in router mode.

Wireless	Displays current wireless status. Click the panel to configure wireless settings.
AOSS/WPS	Displays current AOSS/WPS status. Click the panel to run AOSS/WPS.
USB Storage	Displays the status of USB storage connected to this product. Click the panel to configure USB storage settings.
Guest Accounts	Displays current guest accounts status. Click the slider to turn guest accounts on or off. Click the panel to configure guest accounts settings.
QoS	Displays current QoS status. Click the slider to turn QoS on or off. Click the panel to configure priority control QoS.
Web Filtering	Displays current content filter status. Click the panel to configure web filtering.
Network Devices	Displays the number of devices connected to the network. Click the panel to check each device's status.
Advanced Settings	Click the panel to configure advanced settings.

### <u>Wireless</u>

Configure basic wireless settings here. This is available in router and access point modes only.

BUFFALO	ń 🕷	0 🗴 🗗
🔶 Wireless LAN		
2.4 GHz (11n/g/b) ✓ Enable	5 GHz (11n/a)	\$,
SSID 1 Buffalo-G-0D31	SSID 1 Buffalo-A-0D31	
Encryption WPA2-PSK AES	Encryption WPA2-PSK AES	
Encryption Key Safevakyca 3mt	Encryption Key 5afcraktyca 3mt	
Channel T	Channel Auto Channel	-
Bandwidth	Bandwidth	
210.1 mops (20 mitz)	450 mbps (40 min2)	
	В	ack Apply
AirStation WZR-900DHP Version 2.09		Copyright © 2013 Buffalo Inc.

2.4 GHz (11n/g/b)	You may enable or disable either wireless frequency range independently. If both		
5 GHz (11n/a)	wireless radios are disabled, the AirStation will not communicate wirelessly.		
SSID 1	Each SSID may contain up to 32 alphanumeric characters.		
	The following types of encryption are available:		
	WPA2-PSK AES		
	WPA2 authentication with AES encryption is the best system available. Highly recommended if all your wireless clients support it.		
	WPA-PSK AES		
Encryption	WPA authentication with AES encryption is an older system, but still secure.		
	WPA/WPA2-mixed PSK TKIP+AES		
	For maximum compatibility, this system allows any combination of WPA, WPA2, TKIP, and AES. This encryption system works with most older clients but is not very secure.		
	No Encryption		
	No encryption means that anyone can log in to your wireless network, snoop on your wireless traffic, and use your bandwidth. Not recommended for most users.		
Encryption Key	The encryption key is like the "password" for your wireless network. It may contain 8 to 63 case-sensitive alphanumeric characters (ASCII) or 64 hexadecimal characters (0-9 and a-f, not case-sensitive).		
	For best results, select Auto Channel. The AirStation will seek and use the clearest		
Channel	channel automatically. Alternately, you may choose a wireless channel manually.		
	In rural areas with little wireless traffic, a larger bandwidth setting may improve wireless		
Bandwidth	performance significantly. However, if you are in an urban area with much wireless traffic and interference, the default bandwidth is recommended.		

### AOSS/WPS

The following window appears when you click the panel. Click OK to start AOSS/WPS.

### USB Storage

Configure USB storage settings here.

Enable	Enable or disable QoS.

Select a policy	Select a policy for communication. Network bandwidth will be optimized for the selected item.
Traffic Monitor	You can check each item's communication status. Z : Priority : Upload speed : Download speed

### Web Filtering

.

Configure web filtering. This is available in router mode only.

Block Malicious Sites	Blocks malware, phishing, and scam sites.
Block Malicious and Adult Sites	Blocks malware, phishing, and sites that contain sexually explicit content.
Block Malicious, Adult, and Other Non-Family Friendly Sites	Blocks malware, phishing, and scam sites, sites that contain sexually explicit material, mature content, abortion, alcohol, crime, cult, drugs, gambling, hate, sexual orientation, suicide, tobacco, and violence.
No Filters	This allows unrestricted access to all websites. You can still configure access control separately.
l agree to Norton's Terms of Service	Web filtering is provided by Symantec Corporation. To enable, you must accept the terms of service.

Norton ConnectSafe must be activated by the customer. Use of Norton ConnectSafe is subject to the terms of service found at https://dns.norton.com/dnsweb/terms.do

## Network Devices

Check the status of each device connected to the network. This is available in router mode only.

IP	Displays the IP address of each device connected to this product.
	Displays uploading and downloading speed of each device connected to this product.
î	Displays the devices connected to the AirStation.
	Click the appropriate icon to open each device's settings.
0	Click the icon to send a Wake-on-LAN packet to the device.

## **Advanced Settings**

### Internet

Configure the WAN-side port ("Internet port") here.

#### Internet - Internet (Router Mode Only)

Method of Acquiring IP Address	<ul> <li>Run Internet Connection Wizard</li> <li>Acquire an IP address automatically from a DHCP server</li> <li>Use PPPoE client</li> <li>Use IP unnumbered</li> <li>Use this address Static IP Address</li> <li>Subnet Mask</li> </ul>
To set up PPPoE, click here.	
Advanced Settings	
Default Gateway	

Default Gateway	
DNS Name Server Address	Primary: Secondary:
Internet MAC Address	<ul> <li>Use default MAC address(10:6F:3F:D3:0D:31)</li> <li>Use this address</li> </ul>
MTU Size of Internet Port	1500 Bytes

Method of Acquiring IP Address	Specify how the WAN-side IP address is obtained.
Default Gateway	Configure an IP address for the default gateway.
DNS Name Server Address	Specify an IP address for the DNS server.
Internet MAC Address	You may use the default MAC address or specify one manually. <b>Note:</b> Configuring an improper MAC address may make the AirStation unusable. Do not change the MAC address unless you know what you're doing!
MTU Size of Internet Port	Configure the MTU value of the Internet port. Values of 578 to 1500 bytes may be entered.

### **PPPoE**

Configure PPPoE settings here.

#### Internet - PPPoE (Router Mode Only)

Route is not registered.

Edit Preferred Connections

Default PPPoE	If you have registered multiple connection destinations in the PPPoE Connection List,
Connection	connection destinations selected here have priority.
IP Unnumbered PPPoE	Select the destination from the PPPoE Connection List to be used when Use IP
Connection	Unnumbered is chosen as the method of acquiring IP address.
<b>PPPoE Connection List</b>	Edit PPPoE destination. You can register up to 5 sessions.
Edit Connection List	Click this button to edit destination settings.

	This is displayed when <i>Edit Connection List</i> is clicked.
	Name of Connection
	Enter the name to identify the connected destination. You may enter up to 32 alphanumerical characters and symbols.
	Username
	Enter the username specified by your ISP for PPPoE certification. You may enter up to 64 alphanumerical characters and symbols.
	Password
	Enter the password specified by your ISP for PPPoE certification. You may enter up to 64 alphanumerical characters and symbols.
	Service Name
	Fill in this field only if your ISP specifies a service name. Leave blank otherwise. You may enter up to 64 alphanumerical characters and symbols.
	Connection Type
	Specifies the timing for the AirStation to connect to your provider.
PPPoE Connection	Automatic Disconnection
	Set time to disconnect after communication is stopped when the connection method is set to <i>Connection on Demand</i> or <i>Manual</i> . You can enter up to 1440 minutes.
	Authentication
	Configure an authentication method with a provider.
	MTU Size
	Configure the MTU (maximum transmission unit) size for PPPoE. Values of 578 to 1492 bytes may be entered.
	MRU Size
	Configure MRU (maximum receive unit) for PPPoE. Values of 578 to 1492 may be entered.
	Keepalive
	If keepalive is enabled, the AirStation will issue an LCP echo request once a minute in order to maintain the connection with the PPPoE. If the server does not respond for more than 6 minutes, the line is recognized as disconnected and the AirStation will terminate the connection. Disabled by default.
Preferred Connections	Displays information you have set regarding to the connection destination route.
Edit Preferred Connections	Click to edit the connection destination route settings.
	Click Edit Preferred Connections to display.
	Name
Preferred PPPoE	The destination to connect by PPPoE if <i>Destination Address</i> and <i>Source Address</i> match. Select the destination registered to the PPPoE Connection List.
Connection	Destination Address
	When communicating to this address, the AirStation will communicate with <i>Name</i> .
	Source Address
	When communicating from this address, the AirStation will communicate with <i>Name</i> .

## **Dynamic DNS**

Configure dynamic DNS settings here. Many settings are only available when the appropriate dynamic DNS service is enabled.

#### Internet - Dynamic DNS (Router Mode Only)

Dynamic DNS Service	Disabled 💌
Current Dynamic DNS	Settings
Internet-side IP Address	180.49.161.65
Domain Name	Disabled
Status	Disabled
Refresh	

Dynamic DNS Service	Select a supported dynamic DNS provider (DynDNS or TZO).
Username	Enter the dynamic DNS username. You may enter up to 64 alphanumerical characters and symbols.
Password	Enter the dynamic DNS password. You may enter up to 64 alphanumerical characters and symbols.
Hostname	Enter the dynamic DNS hostname. You may enter up to 255 alphanumerical characters, hyphens, and periods.
Email Address	Enter the email address which is registered to the dynamic DNS service. You may enter up to 64 alphanumerical characters and symbols.
TZO Key	Enter the TZO key which is registered to the dynamic DNS service. You may enter up to 64 alphanumerical characters and symbols.
Domain Name	Enter the domain name which is registered to the dynamic DNS service. You may enter up to 255 alphanumerical characters, hyphens, and periods.
IP Address Update Period	Specifies the period to notify the dynamic DNS service provider of the current IP address. For DynDNS, set it between 0 and 35 days. For TZO, set it between 0 and 99 days. If 0 (zero) days is set, no periodic update is performed.
Internet-side IP Address	The WAN-side IP address of the AirStation's Internet port. This address is sent to the dynamic DNS service provider.
Domain Name	The domain name assigned by the dynamic DNS service provider. The AirStation can be accessed from the Internet using this domain name.
Status	Displays the status of the dynamic DNS service.

### **PPTP**

Output Power	100 %

WMM-EDCA Parameters

WMM Settings 🔲 Display

Wireless	Determines whether to allow wireless communication. If this is unchecked, no wireless connections will be allowed.		
Wireless Channel	Sets a channel (a range of frequencies) for wireless connections. With <i>Auto Channel</i> selected, the AirStation will automatically use the best available channel.		
High-Speed Mode	Configure the bandwidth for wireless communication. To increase communication rate, set the bandwidth to 40 MHz and configure extension channel.		
Broadcast SSID	If <i>Allow</i> is checked, then the AirStation will respond to SSID searches from wireless devices by broadcasting its SSID. If <i>Allow</i> is unchecked, the AirStation ignores SSID searches from wireless devices.		
SSID 1 SSID 2	Enable or disable the main SSID (SSID 1) and sub SSID (SSID 2).		
SSID Isolation	Enable to make wireless devices connected to the specified SSID be able to communicate only with the Internet-side.		
	Select an authentication method for SSID 1 from below:		
	WPA/WPA2-mixed mode PSK		
	Allows the authentication compatible with W/DA_DCK and W/DA2_DCK at the same time		
	WDA 2-DCK		
Windless Authorities			
wireless Authentication	Allows the authentication compatible with WPA2 (IEEE 802.111).		
	Allows the authentication compatible with WPA (Wi-Fi Protected Access).		
	No Authentication		
	Connect to wireless clients without any authentication method.		
	You may use any of the following types of encryption:		
	TKIP/AES mixed mode		
	<i>TKIP/AES mixed mode</i> allows both TKIP and AES authentication and communication. This is no more secure than TKIP alone, but more convenient for some users. <i>TKIP/AES mixed mode</i> can be selected only when <i>WPA/WPA2 mixed mode - PSK</i> is selected for wireless authentication.		
	AES		
Encrypt Wireless Data	AES is more secure than TKIP, and faster. Use a pre-shared key to communicate with a wireless device. AES can be selected only when WPA-PSK or WPA2-PSK is selected for wireless authentication.		
	No Encryption		
	Data is transmitted without encryption. With this setting, anyone within range can connect to your wireless network and might be able to access data on the network. Not recommended for anyone with private data that needs to be kept secure. <i>No Encryption</i> can be selected only when <i>No Authentication</i> is selected for wireless authentication.		
	A pre-shared key or passphrase is the password for your wireless connections. There are		
WPA-PSK (Pre-s hared Keys)	two different formats for a pre-shared key. Use 8 to 63 alphanumeric characters (case- sensitive) for an ASCII passphrase, or use 64 alphanumeric characters (0 to 9 and a to f, not case-sensitive) for a hexadecimal passphrase.		
Key Renewal Interval	Set the update interval for the encryption key between 0 and 1440 (minutes).		
	A WEP encryption key (passphrase) may have any of four different formats. An		
WEP Encryption Key Settings	ASCII passphrase may use either 5 or 13 alphanumeric characters (case-sensitive). A hexadecimal passphrase may use either 10 or 26 alphanumeric characters (0 to 9 and a to f not case-sensitive)		
	RSS (hasic service set) configures the transmission rate of control communication frames		
BSS Basic Rate Set	for a wireless client. Setup choices may vary with different wireless clients.		
Multicast Rate	Set the communication speed of multicast packets.		

F				
802.11n Protection	Enable to use 802.11n protection. 802.11n protection gives priority to 802.11n devices in mixed mode (11b/g or 11 A) networks.			
DTIM Period	Set the beacon responding interval (1 -255) for which the AirStation responds to a wireless device. This setting is effective only when power management is enabled for the wireless device.			
Wireless Client Isolation	If enabled, the wireless client isolation blocks communication between wireless devices connected to the AirStation. Wireless devices will be able to connect to the Internet but not with each other. Devices that are connected to the AirStation with wired connections will still be able to connect to wireless devices normally.			
Output Power	This sets the output of the wireless signal. Because the wireless transmission output and signal distance range are nearly proportional, when the wireless transmission output is reduced, the signal distance range also becomes shorter.			
WMM Settings	Check Display to set priorities only for a specific communication.			
	You don't usually need to change these settings. Using the default settings is recommended.			
	Priority			
	The following priorities may be applied to individual transmission packets: (Highest) 8, (High) 4, (Normal) 2, and (Low) 1. From the queue, these packets are processed in order of priority.			
	CWmin, CWmax			
	The maximum and minimum value of the contention window. The contention window is used in the frame collision avoidance structure performed in IEEE802.11, and generally, the smaller the value in the window, the higher the probability that the queue obtains the right to send.			
WMM_EDCA Paramotors	AIFSN			
	The interval to send frames. The unit of the AIFSN is a slot, just as the window defined by CWmin and CWmax is. The smaller the interval of sending frames, the faster the algorithm can restart. As a result, the priority of the queue is higher.			
	TXOP Limit			
	The period of time that the queue can use after obtaining the right to send. The unit is 32 ms. The longer this time, the more frames can be sent per right to send. However, the queue may interfere with other packet transmissions. If <i>TXOP Limit</i> is set to 0 (zero), only one frame can be sent per right to send.			
	Admission Control			
	Restricts new frames from interfering with a previous queue. New packets are prioritized lower until a queue of them is collected. As the new queue accumulates more packets, its priority increases.			

### WPS

WPS (Wi-Fi Protected Setup) enables users to easily configure wireless networks and add new devices.

#### Wireless - WPS (Router and Access Point Modes Only)

WPS	Enable		
External Registra	r 🗹 Enable		
AirStation PIN 8	i325562 Ge	nerate PIN	
WPS PIN		ОК	
WPS Security S	ettings		
WPS Status		Configured	Release
11n/g/b		SSID Security Encryption Key	Buffalo-G-0D31 WPA2-PSK AES 5afcvakxca3mt
11n/a		SSID Security Encryption Key	Buffalo-A-0D31 WPA2-PSK AES 5afcvakxca3mt

WPS	Enable to use WPS automatic configuration.
Extornal Dogistrar	Enable to accept configure requests from other WPS devices.
External Registrar	Note: Configure requests will not be accepted if AOSS is in use.
AirStation PIN	Displays the PIN code of the AirStation. Clicking <i>Generate PIN</i> will generate a new PIN
	code. This code can be entered into other wireless devices that support WPS.
WPS PIN	Enter the PIN code for the other wireless device and click OK.
WDC Status	Displays configured if all available wireless bands are configured. Displays unconfigured if
	at least one wireless band is unconfigured.

## AOSS

AOSS (AirStation One-Touch Secure System) is a system for easily configuring a secure wireless home network. It was developed by Buffalo.

#### Wireless - AOSS (Router and Access Point Modes Only)

AOSS Settings						
AOSS Status		In use	K			
Allow WEP for Game Consoles Only		802.11n/g 802.11n/a	)/b 🗌 Enable a 🗌 Enable

AOSS Client Information						
Name	MAC Ac	ddress	Encryption T	уре	Wireless	AOSS
MacBook	90:27:E4	:F1:2A:4B	WEP64/WEP12 WPA-PSK-TKIP WPA-PSK-AES WEP64/WEP12 WPA-PSK-TKIP WPA-PSK-AES	28 (802.11n/g/b) 28 (802.11n/a)	-	AOSS
EC Devices / Non-AOSS Devices	9C:2A:70	:4D:0D:D6			802.11n/a/b	-

AOSS Status	Displays current AOSS status. Click 🔛 to disconnect AOSS connection when it is enabled. (SSID and encryption key will return to the previous setting.)
Allow WEP for Game Consoles Only	This allows game consoles that only support WEP to connect to the network.
AOSS Button on The AirStation Unit	If <i>Enable</i> is unchecked, only WPS runs when you press the button.
AOSS Client Information	Displays the information of the clients connected to this product via AOSS and communicating with this product wirelessly.
	Displays the name of the clients.
	MAC Address
	Displays the MAC address of the clients.
	Encryption Type
	Displays the encryption type the clients can use.
	Wireless
	Displays current connection method.

## **MAC Filtering**

Restrict access to specific wireless devices here.

#### Wireless - MAC Filtering

Enforce MAC Filtering	Enable to restrict wireless connections to devices with registered MAC addresses.
Registration List	Displays the MAC addresses of registered devices which are permitted to connect wirelessly.
Edit Registration List	Adds a wireless device to the list of permitted devices.
Enter MAC Addresses	Enter a MAC address of a wireless device to permit to connect to the AirStation. Click <i>Register</i> to add that MAC address to the list.
<b>Connected Client's List</b>	Display the list of all MAC addresses of wireless devices connected to the AirStation.

## **Multicast Control**

Configure restrictions on unnecessary multicast packets sent to the wireless LAN port here.

#### Wireless - Multicast Control

Snooping	If enabled, snooping supervises multicast administrative packets such as IGMP and restricts unnecessary multicast transfers to wired or wireless ports.	
Multicast Aging Time	Set the time to hold the data from multicast snooping in the range of 1 to 3600 (seconds). Enter a value bigger than the IGMP/MLD query interval.	

### **Guest Accounts**

Configure the AirStation's guest accounts here.

#### Wireless - Guest Accounts (Router and Access Point Modes Only)

Guest Account Settings				
Guest Accounts		Enable		
Guest User Authentication		Enable		
Guest Account LAN IP Address		<ul><li>Auto</li><li>Manual Setting</li></ul>

Guest Accounts	Enable or disable the guest accounts.		
Guest User Authentication	This sets whether authentication is performed for guest users.		
Guest Account LAN IP Address	This sets the LAN-side IP address for the guest accounts.		
Guest Account DHCP Server	This sets whether IP addresses are automatically assigned for devices connected to the guest accounts.		
Permitted Access Time	Set the time frame for Internet access for the guest accounts.		
SSID	This sets the SSID for the guest accounts.		
Wireless Authentication	This sets whether wireless authentication is performed for the guest accounts.		
Wireless Encryption	This sets the wireless encryption system for the guest accounts.		
WPA-PSK(Pre-shared Key)	This sets the wireless encryption key for the guest accounts.		
Key Renewal Interval	Set the update interval for the encryption key for the guest accounts.		
Edit Guests	Click to register a user to use the guest accounts.		
Username	Enter a name for the guest user.		
Password	Enter a password for the guest user.		
# Wireless Bridge

Configure the AirStation's wireless bridge here.

## Wireless - Wireless Bridge (Wireless Bridge Mode Only)

Wireless Bridge		
Wireless Bridge Status	Not connected	
SSID	-	
Security	-	
Select 5 GHz or 2.4 GHz	Auto (5 GHz priority)	
Repeater	Use SSID and security settings from master	
Physical AOSS Button	V Enable	
To disable wireless LAN n	naster settings, disable wireless from <u>5 GHz</u>	and <u>2.4 GHz</u> .
Manual Connection		
Open		
WPS Connection		
PIN Code Method St	art WPS (PIN)	

#### AOSS Connection

Pushbutton Method Start WPS (PBC)

Wireless Bridge Status	Displays wireless bridge status.
SSID	Displays the master's SSID.
Security	Displays the type of security used by connection with the master.
Select 5 GHz or 2.4 GHz	Set the priority for the connection with the master.
Repeater	When checked, the AirStation will use the wireless settings of the master device.
Physical AOSS Button	Uncheck Enable to disable AOSS and WPS.
Manual Connection	Click to search master devices. Select a master device and enter the encryption key.
PIN Code Method	Click <i>Start WPS (PIN)</i> to issue PIN code and search master devices. Select a master device and click <i>Run PIN</i> to start WPS. Register PIN code to the destination master device within 2 minutes.
Pushbutton Method	Click <i>Start WPS (PBC)</i> to start WPS. Press master device's AOSS/WPS button within 2 minutes.
Execute AOSS	Click 🔤 to start AOSS. Press master device's AOSS/WPS button within 2 minutes.

# **Firewall**

Configure the AirStation's firewall here.

## Security - Firewall (Router Mode Only)

Enable	Basic Rules	Number of Packets
	Prohibit NBT and Microsoft-DS routing PPPoE1: Easy SetupProhibit	0
<b>V</b>	Reject ident requests	0
	Block ping from Internet  PPPoE1: Easy SetupIgnore	0

	Enable to use any of the quick filters. Preconfigured quick filters include:
	Prohibit NBT and Microsoft-DS routing
	Enabling this blocks communication using these protocols from the WAN side to the LAN side or from the LAN side to the Internet. You can configure this with PPPoE if you select <i>Use PPPoE client</i> or <i>Use IP Unnumbered</i> for the method of acquiring IP Address, or if Easy Setup identified a PPPoE connection during setup.
	Reject ident requests
Basic Rules	Enabling this option will answer ident requests from the Internet side with corresponding rejection packets. Enable this option if you experienced slow transfer speeds for network applications such as email, FTP, and web browsing. If you have configured transfer of ident requests to the LAN-side computer in the address translation settings (DMZ or TCP port 113), then that setting has higher priority, and overrides this setting.
	Block ping from Internet
	If this is enabled, the AirStation will not respond to pings from the Internet side. You can configure this with PPPoE if you select <i>Use PPPoE client</i> or <i>Use IP Unnumbered</i> for the method of acquiring an IP address, or if Easy Setup identified a PPPoE connection during setup.

# **IP Filter**

Create and edit IP filters here.

## Security - IP Filter (Router Mode Only)

#### Add IP Address Based Filter Action Stop incoming packets Direction Internet->LAN 💌 IP Address Source Address: -> Destination: O All ◎ ICMP Protocol Protocol Number: Manual TCP Port Manual Setting - TCP/UDP Port Number: Add Rule **IP** Filter Action Direction Source Address Protocol Count Customize No IP filters have been configured yet.

Action	Specify how to process target packets.
Direction	Specify the transmission direction of target packets.
IP Address	Specify the sender's IP address and receiver's IP address of the target packets.
Protocol	Select a protocol for target transmission packet.
IP Filter	Display the list of IP filters which have been registered.

# **VPN Passthrough**

Configure IPv6 passthrough, PPPoE passthrough, and PPTP passthrough here.

## Security - VPN Passthrough (Router Mode Only)

IPv6 Passthrough	Enable
PPPoE Passthrough	🔲 Enable
PPTP Passthrough	Enable

IPv6 Passthrough	Enable to use IPv6 passthrough for address translation.
PPPoE Passthrough	Enable to use PPPoE bridging. PPPoE bridging lets you automatically obtain an IP address from your provider for your LAN-side computer using the PPPoE protocol because PPPoE packets can pass between the Internet and LAN.
PPTP Passthrough	Enable to use PPTP passthrough for address translation.

## **Port Forwarding**

Configure port translation here.

## Security - Port Forwarding (Router Mode Only)

### Forward a Port

Group	New Group	Group Name:	
Internet-side IP Address	AirStation's Internet-side IP Address		
	Manual IP Address:		
Protocol	🔘 All		
	◎ ICMP

LAN-side Port	TCP/UDP Port:		

Add

#### Forwarded Ports

Group Internet-side IP Address Protocol LAN-side IP Address LAN-side Port Port forwarding has not been set up yet.

Group	Specify a group name for a new rule to belong to. Select <i>New Group</i> and enter the new group name in the Group Name field to create a new group. A group name can include up to 16 alphanumeric characters.
Internet-side IP Address	Enter the Internet-side IP address (before translation) for the port translation table entry.
Protocol	Select the Internet-side protocol (before translation) for the port translation table entry.
LAN-side IP Address	Enter the LAN-side IP address (after translation) for the port translation table entry.
LAN-side Port	Select the LAN-side (after translation) port number (1 - 65535) for the port translation table entry.
Forwarded Ports	Shows current entries in the port translation table.

# DMZ

Configure a destination for packets that don't have a LAN-side destination.

## Security - DMZ (Router Mode Only)

Add IP Address to DMZ

\* The IP address of this computer is 192.168.11.2.

Add IP Address to DMZ	Enter the IP address of the destination to which packets which are not routed by a port translation table are forwarded.
	Note: RIP protocol packets (UDP port number 520) will not be forwarded.

## **UPnP**

Configure UPnP (Universal Plug and Play) here.

### Security - UPnP (Router Mode Only)

UPnP 🛛 Enable

UPnP Enable or disable Universal Plug and Play.

# Web Filtering

### Security - Web Filtering (Router Mode Only)

#### Filter Level

Add

Norton ConnectSafe must be activated by the customer. Use of Norton ConnectSafe is subject to the terms of service found at https://dns.norton.com/dnsweb/terms.do.

Filter Level	Select the filter level.
Websites Excluded from	Specify a list of websites that will be unaffected by the web filter. Click Add and enter any
Filter	website (up to 20 are allowed). You can edit or delete entered entries.
Computers Excluded from Filter	Set a list of computers on the network that will be unaffected by the web filter. Click <i>Add</i> and enter a computer's MAC address (up to 20 are allowed). You can edit or delete entered entries.

## **Access Control**

### Security - Access Control (Router Mode Only)

```
Access Control Enable
MAC Address Status Operation
No registered MAC addresses.
Add
```

Access Control	Check to enable access control. Click Add to configure the schedule.	
Add Access Control	Enter the computer's MAC address in the "Target Computer" field. You can add up to 20 network computers.	
Permitted Access Time	<b>ne</b> Displays the time that the computer is allowed to access to the Internet.	
Register	Configure and register the schedule.	

## **Disk Management**

View the status of and configure attached USB drives here.

### **Applications - Disk Management**

Add

Automatic USB Drive<br/>AssignmentEnable or disable automatic USB drive assignment.AdvancedCheck Display to display the advanced functionality.Character Code for FATSpecify the file name character code used for FAT-formatting.Sleep ModeEnable or disable sleep mode.

Sleep Mode Interval	eep Mode IntervalWhen the drive is not used for a specified amount of time, it will be shut down automatically. You can choose a time from 1 to 300 minutes.					
Device	Displays the manufacturer, product name and unit name of the connected USB devices.					
Disk Assignment	Select a number of the drive or <i>Do not assign</i> .

Add

Power Saving	Enable to schedule eco Mode. If eco Mode is enabled, AOSS will function only when the AirStation is in normal operating mode.		
Custom Mode	Individual power saving elements may be configured for custom mode.		
Weekly Schedule	Graphically displays the configured schedule.		
Schedule Entry	Configure operational mode for time periods in the weekly schedule.		

# Network USB

Network USB allows a computer on the wired or wireless LAN to connect to a USB device connected to the AirStation as though it were directly connected to the computer. Printers connected in this way support 2-way communication, so ink-level notifications and similar functions will work normally. Only one computer can connect to the USB device at a time.

Note: Network USB is recommended for printer use. Other USB devices are not supported at this time.

## **Applications - Network USB**

Network USB I Leable

Network USB	Enable to allow a computer on the wired or wireless LAN to connect to a USB device connected to the AirStation as though it were directly connected to the computer. Disable to reduce the load on the NAS, improve performance, or for security reasons.
Use Multifunction Printer	This uses a multifunction printer supporting mass storage classes as a printer. Disable if using as a NAS instead.

# **System**

Configure basic AirStation settings here.

## Admin - System

AirStation Name	Enter a name for the AirStation. Names may include up to 64 alphanumeric characters and hyphens (-).
Administrator	The name of the administrator account is "admin".
Administrator Password	The administrator password may contain up to 8 alphanumeric characters and underscores (_).
Prohibit configuration from wireless LAN	If enabled, prevents access to configuration interface from wirelessly connected devices (only wired devices may configure).
Prohibit configuration from wired LAN	If enabled, prevents access to configuration interface from wired devices (only wirelessly connected devices may configure).

Permit configuration from wired Internet	If enabled, allows access to configuration interface from network devices on the WAN (Internet) side.			
Permitted IP address	Displayed only if Internet-side configuration is enabled. Enter the IP address of a device that is permitted to configure the AirStation remotely from the WAN (Internet) side.			
Permitted Port	Displayed only if Internet-side configuration is enabled. Set a port number (1 - 65535) to configure the AirStation from the WAN (Internet) side.			
Limit network scanning	If checked, network scanning will not be able to determine which devices have network settings GUIs available. You will have to open Settings for network devices directly.			
NTP Functionality	Enable to use an NTP server.			
NTP Server	Enter the name of the NTP server as a hostname, hostname with domain name, or IP address. Up to 255 alphanumeric characters, hyphens (-), and underscores (_) may be used. The default is <i>time.nist.gov</i> .			
Update Interval	How often will the AirStation check the NTP server for the correct time? Intervals of 1 - 24 hours may be set. The default is 24 hours.			
Local Date	You may manually set the date of the AirStation's internal clock.			
Local Time	You may manually set the time of the AirStation's internal clock.			
Time Zone	Specify the time zone (offset of greenwich mean time) of the AirStation's internal clock.			
DST (Daylight Saving Time)	You may configure the AirStation to automatically use DST (daylight saving time). If selected, the AirStation will automatically adjust the time at the beginning and end of DST.			

# **Syslog Settings**

You may transfer the AirStation's logs to a syslog server.

## Admin - Syslog Settings

## **Ping**

A ping test checks whether the AirStation can communicate with a specific network device.

### **Status - Ping**

 Destination Address

 Execute

 Result

 Destination
 192.168.11.2

 Result

 Result

 64 bytes from 192.168.11.2: icmp\_seq=0 ttl=128 time=0.5 ms

 64 bytes from 192.168.11.2: icmp\_seq=1 ttl=128 time=0.4 ms

 64 bytes from 192.168.11.2: icmp\_seq=3 ttl=128 time=0.4 ms

 64 bytes from 192.168.11.2: icmp\_seq=3 ttl=128 time=0.4 ms

Destination Address	Enter the IP address or hostname of the device that you are testing communication with,
Destination Address	then click <i>Execute</i> . The result will be displayed below.

# **Chapter 3 - Wireless**

## **Wireless Options**

You may use any of the following methods to connect devices to the AirStation wirelessly.

### **Manual Configuration**

On your device, search for available networks and find the AirStation. If a password is required, enter the AirStation's encryption key.

### WPS (Wi-Fi Protected Setup)

WPS is an automatic connection method created by the Wi-Fi Alliance. Two different versions of WPS are supported: pushbutton and PIN. For pushbutton, start WPS on your client device, then press the AOSS button on the AirStation. Alternately, if your wireless client has a WPS PIN, you may use the Client Manager to enter the PIN in the AirStation. With either of these methods, a wireless connection will be established automatically within a couple of minutes.

### Notes:

- WPS supports Windows 8.1, Windows 8, Windows 7, and Windows Vista (SP 2).
- Mac OS is not supported.

### AOSS (AirStation One-Touch Secure System)

AOSS is a proprietary system by Buffalo that lets you set up a secure wireless connection with the push of a button. Press your device's and the AirStation's AOSS buttons and a secure wireless connection will be configured automatically.

#### Notes:

- To use AOSS with a Windows PC, install Client Manager.
- To use AOSS with Mac, install AOSS Assistant.

## **Advanced Wireless Configuration**

# Manual Configuration (SSID and Password)

- 1 Click the wireless icon.
- Select your AirStation's SSID from the list.
   Note: Your AirStation's default SSID and encryption key are on the setup card stored in the base of the AirStation.

### **3** Enter the AirStation's encryption key.

💱 Connect to a Netwo	rk	×
Type the network	security key	
Security key:	12345678	]
	Hide characters	
<b>9</b>	You can also connect by pushing the outton on the router.	
	ОК	Cancel

**4** The connection will be established.

# Automatic Secure Setup (WPS)

- 1 Click the wireless icon.
- 2 Select your AirStation's SSID from the list.

Note: Your AirStation's default SSID is on the setup card stored in the base of the AirStation.

**3** Without entering a password, press the AOSS button on the AirStation.

Notes:

- WPS supports Windows 8.1, Windows 8, Windows 7, and Windows Vista Service Pack 2 only.
- Mac OS is not supported.

4

The connection will be established.

## Automatic Secure Setup (AOSS)

- **1** Windows users should download Client Manager from Buffalo's website and install it. Mac users should download AOSS Assistant and install it.
- 2 Initiate AOSS from Client Manager or AOSS Assistant.

**3** Press your AirStation's AOSS button.

**4** The connection will be established.

# Adding an AirStation to an Existing Wireless Network as a <u>Client</u>

In a network that already has a wireless access point, the AirStation can serve as a wireless client. It can connect wirelessly to the existing wireless network and other devices can be connected to its Ethernet ports.

To configure the AirStation as a wireless client, navigate to *Wireless > Wireless Bridge* in Settings.

Under "Manual Connection", click Configure.

Select your access point (AP) from the list of detected wireless devices. Select settings for "Wireless Authentication" and "Encryption" to match the AP's settings, then click *OK*. The AirStation is now connected as a wireless client, and Ethernet devices connected to it can use the AP's Internet connection.

# **Chapter 4 - Utilities**

## How to Download Utilities

You can download utilities for your AirStation from Buffalo's website.

WZR-900DHP: http://d.buffalo.jp/wzr-900dhp/WZR-600DHP2: http://d.buffalo.jp/wzr-600dhp2/

	Settings (V	Veb Admin Interface)	
	Cha	nge IP Address	

#### Compatible with:

WIndows 8.1, Windows 8, Windows 7, Windows Vista, Windows XP OS X 10.9, 10.8, 10.7, 10.6, 10.5, 10.4

# Network-USB Navigator

You can use a printer connected to the AirStation's USB port via any computer in your network with this software.

Note: Concurrent use by multiple computers is not supported.

### Compatible with:

Windows 8.1, Windows 8, Windows 7, Windows Vista, Windows XP OS X 10.9, 10.8, 10.7, 10.6, 10.5, 10.4

# **Client Manager**

Use this software to let your Windows PC connect to the AirStation with AOSS.

Client Manager V supports Windows 8, Windows 7, and Windows Vista.

Client Manager 3 supports Windows XP.

**Note:** If Client Manager 3 is installed on your computer, Wireless Zero Config is disabled. Uninstall Client Manager 3 to use Wireless Zero Config, or just use Client Manager 3 to connect to the AirStation.

### Compatible with:

Windows 8.1, Windows 8, Windows 7, Windows Vista, Windows XP

# **AOSS Assistant**

Use this software to let your Mac connect to the AirStation with AOSS.

### Compatible with:

OS X 10.9, 10.8, 10.7, 10.6, 10.5, 10.4

## **WLAN Monitor**

You can check the radio wave condition, connection speed, signal quality, and signal level with this tool.

8	WLAN Monitor
BUFFALD	270 Mbps
Network Name (SSID) - BUFFALO-123456(Man	ual)_A 77 %
Status	Connected -30 dBm
IP Address	192.168.10.17
A Security	WPA2 Personal
- Encryption	AES
Band	5 GHz (11n/a)
Channel	48
Link Speed	270 Mbps
Quality	77 %
Signal Level	-30 dBm

### Compatible with:

OS X 10.9, 10.8, 10.7, 10.6, 10.5, 10.4

# **Chapter 5 - Troubleshooting**

## **Finding Your AirStation on the Network**

By default, your AirStation is accessible on your local network at the IP address 192.168.11.1 with subnet mask 255.255.255.0. If this address has been changed and you don't know the new address, you can reset the AirStation to its default settings by holding down the reset button for 3 seconds.

You can also find your AirStation on the network with the AirStation Configuration Tool. This software will detect AirStations on your network and give you the IP address and MAC address of each.

## **Eliminating Dead Spots in Wireless Coverage**

If there are spots in your house with poor wireless coverage, try moving your AirStation. Sometimes even moving it a few feet can eliminate dead spots in the area. Also, in Settings, make sure that the wireless output power of the AirStation is set to 100% for maximum range.

## **If Your Wireless Connection Is Not Stable**

Many household devices such as microwaves and cordless phones can interfere with some channels of the spectrum available for the AirStation. If your wireless connection is unstable, change the wireless channel setting to *Auto Channel* for both the AirStation and your wireless client device. The AirStation will then choose the clearest channel automatically.

Make sure that the 5 GHz band is enabled. The AirStation is a dual band router, and either band will work well, but the 5 GHz band will usually have less interference.

## **Basic Router Troubleshooting**

If your router is not behaving normally, begin by using the resetting all settings. With the unit connected to power, hold down the reset button for 3 seconds. This will reset all settings to their defaults. The local IP address of the router will now be 192.168.11.1 with a 255.255.255.0 subnet mask.

Connect your PC to one of the Ethernet ports on the router. Give the computer a manual (fixed) IP address on the same subnet as the router such as 192.168.11.2. Set the subnet mask to 255.255.255.0.

Open a browser (such as Firefox) on your computer and type 192.168.11.1 into the URL window. Click *Go*. The router's settings page should open.

Enter the router's username and password ("admin" and "password" by default).

You should now be able to reconfigure your settings and change your password for the router.

## Basic Router Troubleshooting from a Mac

If your router is not behaving normally, begin by using the resetting all settings. With the unit connected to power, hold down the reset button for 3 seconds. This will reset all settings to their defaults. The local IP address of the router will now be 192.168.11.1 with a 255.255.255.0 subnet mask.

Connect your Mac to one of the Ethernet ports on the router. In *System Preferences - Network - Ethernet*, give the computer a manual (fixed) IP address on the same subnet as the router such as 192.168.11.2. Set the subnet mask to 255.255.255.0.

If your Mac doesn't have an Ethernet port, connect it to the AirStation wirelessly instead. The AirStation's default SSID and passphrase are printed on the setup card in the bottom of the router. Use this information to connect wirelessly. Then, give the computer a fixed IP address on the same subnet as the router such as 192.168.11.2 and set the subnet mask to 255.255.255.0.

Open a browser (such as Safari) on your computer and type 192.168.11.1 into the URL window. Click *Go*. The router's settings page should open.

Enter the router's username and password ("admin" and "password" by default).

You should now be able to reconfigure your settings and change your password for the router.

# **Appendix A - Supplemental Information**

# Package Contents

The following items are included in your AirStation package. If any of the items are missing, please contact your vender.

#### **Shared Folders and USB Ports**

There are several restrictions on using the AirStation's USB port:

- When using two-byte characters (such as Japanese), keep folder and file names within 80 characters. You may not be able to copy a folder or a file whose name length is more than 80 characters.
- You cannot set attributes (hidden or read-only) for folders or files on the AirStation.
- When using access restrictions, you can register up to 16 users for the AirStation.
- Please note that you are not allowed to use any of the following words as a user or group name: adm, administrator, all, bin, daemon, disk, ftp, guest, halt, hdusers, kmen, lp, mail, man, news, nobody, nogroup, none, operator, root, shadow, shutdown, sshd, sync, sys, ttyusers, utmp, uucp, www.
- Please note that you are not allowed to use any of the following words as a shared folder name: global, homes, printers, bittorrent, disk1\_pt1, disk1\_pt2, disk1\_pt3, disk1\_pt4, disk2\_pt1, disk2\_pt2, disk2\_pt3, disk2\_pt4, disk3\_pt1, disk3\_pt2, disk3\_pt3, disk3\_pt4, disk4\_pt1, disk4\_pt2, disk4\_pt3, disk4\_pt4.
- If a file created on a Mac contains any of the following characters, it will not be displayed correctly under Windows. Also, you cannot copy or properly display a file when connecting via SMB from Mac OS if it contains any of these characters:

?[]/¥=+<>;:", |\*

- Cancelling or aborting a file copy may leave the file incomplete, and you may no longer be able to delete the incomplete file. This can also happen during a power outage or if the LAN cable is suddenly disconnected. If it happens, restart the AirStation, delete the file, and try copying the file again.
- Use the same username and password for the AirStation as the user's Windows login. If they are different, the user may not be able to access shared folders with access restrictions on the AirStation.
- Date and time stamps stored on the USB hard drive may be updated by the OS accessing the AirStation. File creation or access dates may not be maintained.
- If you view the size of a hard drive from Settings, it shows a bigger value than when you see it in Windows' drive properties. This is because Settings shows the size of the drive in gigabytes but Windows shows it in gibibytes.
- If you have logged in using a "guest" account from Windows 8, Windows 7, Windows Vista, Windows XP, or Windows 2000, access restrictions may not work properly. A (different) guest account already exists on the AirStation.
- If you access a shared folder from a Mac, additional Mac OS information files may be automatically generated. Do not delete these files from a Windows computer. Otherwise, you may no longer be able to access folders from a Mac.
- Device types that can be connected to the AirStation's USB connector are USB hard drives, USB memory sticks, USB printer, or USB card readers. Card readers with 5 or more slots are not supported. USB devices such as digital cameras, CD/DVD drives, mice, and keyboards are not supported.
- Encrypted USB hard drives are not supported.
- If your hard drive has an Auto power mode switch, move the switch to *manual* or *on* position. Leaving the switch set to *auto* may result in unpredictable behavior.

- Up to 4 partitions can be recognized on a USB hard drive.
- Available file systems for USB hard drives are FAT12, FAT16, FAT32, and XFS.

### **GPL Information**

The source code for Buffalo products that use GPL code is available at http://opensource.buffalo.jp/.

# **Appendix B - Tutorials**

#### **Configuring the AirStation for Optimal Performance and Security**

Some basic configuration tips to help improve your router performance and security.

## **Performance**

- Put the AirStation in an elevated spot near the center of your house or coverage area, but away from other devices that might cause interference.
- Experiment with strategic locations to improve signal strength. To reduce interference, keep the router away from cordless phones and microwaves.
- In populated areas, leave automatic channel selection enabled and use 20 MHz wide channels. In less crowded areas, 40 MHz wide channels may offer better performance.
- Use QoS (Quality of Service) to give priority to services that need the most data.

### **Security**

- Use AES (Advanced Encryption Standard) as the encryption. WEP offers virtually no protection at all.
- Enable the built-in AirStation firewall to prevent certain types of network traffic from reaching your computer.
- Enable IP filtering to control what IP traffic to allow into and out of your network for further access control.
- If you are using an unsecure network (e.g. WEP) and you wish to keep that access point separate from the rest of the network, enable SSID isolation. The unsecure router will still be able to access the Internet, but will be kept separate from the rest of the network.

#### **Sharing a Printer**

A USB printer attached to the AirStation can be made available to the network for wireless printing. You will need to download and install the Network-USB Navigator application from the Buffalo website.

Before proceeding, make sure the printer is installed on your PC with the correct printer drivers/software. If the PC does not have the required drivers, even if Network USB Navigator detects the printer you will not be able to print to the device.

#### **Enabling Network USB on the AirStation**

- **1** Open the AirStation's Settings page and navigate to *Applications Network USB*.
- 2 Enable Network USB. If the printer has multiple functions (e.g. scanning), enable Use Multifunction Printer as well.

#### Installing and Using Network-USB Navigator

- **1** Download the Network-USB Navigator software from the Buffalo website.
- **2** Open the application and install it on your PC, following the directions on the screen.
- **3** Connect the USB printer to the AirStation. Make sure the printer is powered on.
- **4** Open Network-USB Navigator. The printer should appear as a network device.
- **5** Select the printer and click *Connect*.

The printer should now be connected and available for wireless printing over the network.

#### **Configuring the Web Filter**

You can apply a web content filter to prohibit access to sites that contain objectionable content. You can access the web filter settings from the Easy Admin page, or by navigating to *Security - Web Filtering*.

You must first accept the Symantec terms of use before you can use web filtering.

LAN	Filter Level	
Wireless	Block Malicious Sites	
Security	Blocks malware, phishing, and scam sites.	Norton <sup>®</sup>
Firewall	<ul> <li>Block Malicious and Adult Sites Blocks malware, phishing, and scam sites that contain sexually explicit content</li> </ul>	by Symantec
IP Filter	Block Malicious, Adult, and Other Non-Family Friendly Sites Blocks malware, phishing, and scam sites, sites that contain sexually explicit material.	ConnectSafe
VPN Passthrough	mature content, abortion, alcohol, crime, cuit, drugs, gambling, hate, sexual orientation, suicide, tobacco, or violence	
Port Forwarding	O No Fitters	
DMZ	This allows unrestricted access to all websites. You can still configure access control separately.	
UPnP	I agree to Norton's Terms of Service	
Web Filtering	"Web Filtering" service is powered by Symantec. You need to accept the	terms of service for the
Access Control	intels to apply.	
Applications	Click here for FAQ	
Admin		

## **Content Filter**

Internet

You can select a filter level to set what kind of sites are blocked by the AirStation. To configure the content filter:

- **1** From the Web Filtering screen, enable content filtering.
- **2** Select the filter level.
- **3** Click Apply.

### Websites Excluded from Filter

Excluded websites can be accessed regardless of the content filter in place. You can register up to 20 excluded sites. To add a website:

- **1** On the Web Filtering screen, click *Add* under "Websites Excluded from Filter" to open the Exclude Website page.
- 2 Enter a website URL (e.g. www.google.com).
- **3** Click *Add*.

You will be returned to the Web Filtering page and the site will be displayed under "Websites Excluded from Filter". You can click *Edit* to make any changes, or *Delete* to remove the entry.

# **Computers Excluded from Filter**

Excluded computers can access any website without being affected by the content filter. You can register up to 20 excluded computers. To add a computer:

- **1** On the Web Filtering screen, click *Add* under "Computers Excluded from Filter" to open the Exclude Computer page.
- 2 Enter a computer's MAC address. If you need help locating a computer's MAC address, consult the computer's manual, or visit the next section.
- **3** Click Add.

You will be returned to the Web Filtering screen and the computer will be displayed under "Computers Excluded from Filter". You can click *Edit* to make any changes, or *Delete* to remove the entry.

### Finding a Computer's MAC Address

Follow the steps below to locate a computer's MAC address.

- 1 On your PC desktop, click on *Start* and type 'cmd' into the Search Bar.
- **2** The Command Prompt appears. Type 'ipconfig /all' and hit *Enter*.

**3** Locate the Physical Address. This is the computer's MAC address.

#### **Configuring Access Control**

You can set up a schedule that dictates when a target computer on the network can (or cannot) access the Internet. To configure this, navigate to *Security - Access Control*.

Add Cancel

- **1** Open Access Control options by clicking *Add*.
- 2 Under Target Computer, enter the computer's MAC address.
- **3** For the added computer, select *Internet Access* or *No Internet Access*.
- 4 Set the start time, end time, and day(s) for the computer's permitted access time. "0" refers to midnight. For example, if you set Computer A to have "Internet Access" from 7:00-10:00 on Thursday and Saturday, then Computer A can only access the Internet during those times and would not be able to get online during other times.
- **5** Click *Edit Permitted Access Time* to save the change.
- **6** You can make additional changes to the schedule if needed by repeating steps 3-5.

#### 7 Click Add.

You will be returned to the Access Control screen, and the computer's access settings will be displayed. You can click *Edit* to modify the permitted access time or other settings, or *Delete* to remove the entry. You can have up to 20 target computers under Access Control.

#### **Port Forwarding Basics**

Port forwarding is a way of configuring the AirStation so that incoming data is automatically directed to specific IP addresses on the network based on the data type.

## Common Uses

Port forwarding allows computers outside your network to access computers on your LAN.

Some applications require port forwarding. For example, if you set up a game server, people outside the network will need to join your server to play the game with you. But the AirStation will automatically block all outside attempts to connect to your LAN. By setting a port number (the port receiving all the connection requests) and the IP address of your game server, the AirStation can then automatically direct the connection requests to the game server, allowing others to join and play.

You will need to know specific ports and corresponding protocols to successfully configure port forwarding. Most network applications and services will have the required ports and protocols in their user documentation.

### **Security**

The risk of having a port "open" to the Internet depends entirely on the application using the open port. If no application is currently connected to the port, all communications to the port will be ignored. Enabling a firewall or other security application will also help reduce security risk.

## <u>UPnP</u>

For the most part, manually configuring port forwarding rules is unnecessary with the advent of UPnP (Universal Plug and Play). UPnP is a protocol that allows a connecting application or device to automatically request and configure a port for you.

Many applications require that UPnP be enabled both in the application's settings and on the router. You can enable UPnP for this AirStation in Settings at *Applications - UPnP*.

#### **Setting Up Port Forwarding Rules**

If UPnP is enabled, most programs will configure this for you automatically. Otherwise, you can manually set rules for port forwarding. You can access port forwarding options by opening the AirStation's Settings page and then navigating to Security - Port Forwarding.

	Forward a Port						
ireless	Crown	Come New Come					
Security	Group	New Group	Group Name.				
Firewall	Internet-side IP Address	AirStation's In	ternet-side IP Address 👻				
	Autoria Side in Address	Manual IP Addr	ess:				
IP Filter		O All					
		O ICMP					
VPN Passthrough	Protocol	O Manual	Protocol Number:				
Dest Converting			TCP Port Manual Setting 👻				
Port Forwarding		TCP/UDP	Port Number:				
DMZ	LAN-side IP Address	192.168.11.2					
	LAN-side Port	TCP/UDP Port					

## **Creating Port Forwarding Rules**

The AirStation can register up to 32 rules. Rules can be managed using the group feature.

Once a group has been created, you can add additional port forwarding rules to that group. You can also turn the group of rules on or off as needed, or select a group of port forwarding rules to be disabled.

- 1 Create a new group name or add to an existing group.
- 2 Specify the WAN-side IP address the AirStation will forward ports from. Using the AirStation's Internet IP address is highly recommended, but you can manually enter an IP address.
- **3** Select a protocol and its corresponding port from the dropdown menu. For example, selecting HTTP will automatically select TCP port 80. If you select any other protocol, you must select a valid port (from 1-65535) as well. The default is TCP/UDP, along with a list of common protocols. If selected, the protocols will use a corresponding port. You can also select *Manual* to manually enter a protocol and its corresponding port.
- 4 Enter the LAN–side IP address of the network computer to receive the forwarded data.
- 5 Enter the LAN-side port. This port will usually be the same as the port set under Protocol. If the port is different, this port will be used to route traffic on the LAN rather than the WAN port. As before, you can select a port from 1-65535.

Once the rule has been added, it will be displayed under the "Forwarded Ports" section.

### **Managing Port Forwarding Rules**

Forwarded Ports						
Group	Internet-side IP Address LAN-side IP Address	Protocol LAN-side Port	Custon	nize		
0	AirStation's Internet-side IP Address 192.168.11.2	FTP (TCP Port: 20-21) FTP (TCP Port: 20-21)	05	Edit Delete		
Groupy	AirStation's Internet-side IP Address 192.168.11.2	HTTPS (TCP Port: 443) HTTPS (TCP Port: 443)	Οπ	Edit Delete		

Individual rules cannot be turned off. Only a rule group can be shut off. You can click *Edit* to make any changes to individual rules, or *Delete* to remove the rule entry.

#### **Configuring a USB Drive as a NAS**

You can use a USB drive as a network-attached storage (NAS) device by plugging it into the AirStation. The files on the device can then be accessed from anywhere on the network.

Note: Not all USB drives are compatible with the AirStation.

### **Setting Up the NAS**

Make sure the USB drive is powered on.

- **1** Connect the USB drive to the AirStation.
- **2** On a computer, open a web browser and access the AirStation's Settings page.
- **3** Navigate to Applications Disk Management.

**4** Enable Automatic USB Drive Assignment.

### **Formatting the Drive**

1

 

 BUFFALO USB Flash Disk

 Disk1 (Automatic Assignment)

 Partition1 (disk1\_pt1)

 Share
 Win/MacOS(Samba) Setting Changes

 Format
 FAT

 Status
 Mounted

 Used/Available (%)
 1,018,836 / 2,007,340 (51%)

 Operation
 Format

From the Disk Management page, click Partition1.

2 AirStation does not support ext3 or NTFS format drives. If the USB drive is in one of those formats, click *Format*.

Execute format Back

**3** Select a format type and click *Execute format* to format the drive. Formatting will erase all data on the drive, so back up any important data beforehand.

#### **User Access**

Set user access restrictions for the drive.

From the Disk Management page, click Partition1.

#### **2** Click Setting Changes.

BUFFALO USB Flash Disk				
Disk1 (Automatic Assignment)				
Partition1 (disk1_pt1)				
Share	Win/MacOS(Samba) Setting Changes			
Format	FAT			
Status	Mounted			
Used/Available (%) 1,018,836 / 2,007,340 (51%)				
Operation Format				

**3** Select the type of access to be given to users and click *Save*.

	Read and Write	-				
	Read and Write		Read Only		No access	
Access Restrictions	×	<-		^ <	guest	
	-	->		->	•	
WebAccess	Access Restrictio	ns				

To create new users, click Add from the Disk Management page.

### **Enable Sharing**

Enable sharing so the drive is accessible by other users on the network.

- **1** Navigate to Applications Sharing.
- 2 Enable *Shared Folder* for the NAS.
- **3** Set the Workgroup name and click *Apply*.

#### **Adding the AirStation to a Wireless Network**

If you have an existing wireless network, you can connect the AirStation to extend the wireless network range. Other client devices (wired and wireless) will be able to connect to the AirStation to use the Internet.

### Set Up the AirStation as an Extender

The AirStation can rebroadcast an existing wireless signal to extend the range. However, the AirStation will maintain its own SSID and security settings.

- 1 Set the mode switch on the back of the AirStation to "WB".
- 2 Connect the AirStation to a computer with an Ethernet cable.
- **3** Move the AirStation next to the access point.
- **4** Open a web browser and enter the AirStation's IP address (default is 192.168.11.100).
- 5 Enter the administrator password and log in.
- **6** Navigate to Wireless Wireless Bridge.

7 If the access point supports WPS or AOSS, you can use either to connect the AirStation. Once the access point is connected and its settings are displayed on the page, click *Apply*.

8

You can also manually select the access point by opening the Manual Connection page. Select the access point from the available list of detected wireless access points. Set the wireless authentication and encryption to match that of the access point and click *OK*. If the access point is not displayed, click *Search Again* to refresh the list. After you are returned to the Wireless Bridge page, click *Apply*.

Wireless	SSID Wireless Authentication Wireless Encryption		Buffalo-A-0D7A			
2.4 GHz			WPA2-PSK	•		
MAC Filtering			AES -			
Multicast Control	WPA-PSK (Pre-shared key):					
Wireless Bridge	Select AP to connect to.					
Applications	Select	SSID		Signal	Encryption	Wireless Mode
Admin	0	7ED6D8A7126BD7042A	3EEB3148EA1003	Excellent	On	n/g/b
Status	۲	Buffalo-A-0	D7A	Excellent	On	ac
	0	WAP-0	;	Weak	On	n/g/b
	0	Buffalo-G-	127A	Weak	On	n/g/b

The AirStation should now be connected as a wireless extender. Configure the AirStation's SSID and security settings on *Wireless - 2.4 GHz (or 5 GHz)*. Once you are finished, you can disconnect the Ethernet cable and move the AirStation to another location that is within range of the access point. Other devices can now connect to the AirStation to use the Internet.

## Set Up the AirStation as a Repeater

If the AirStation is set as a repeater, it will rebroadcast an existing wireless signal and only use the access point's SSID and security settings. Devices within range of both the access point and the AirStation will automatically connect to the stronger signal.

- 1 Set the mode switch on the back of the AirStation to "WB".
- **2** Connect the AirStation to a computer with an Ethernet cable.
- **3** Move the AirStation next to the wireless access point.
- **4** Open a web browser and enter the AirStation's IP address (default is 192.168.11.100).
- 5 Enter the administrator password and log in.

#### **6** Navigate to Wireless - Wireless Bridge.

7 If the access point supports WPS or AOSS, you can use either to connect the AirStation.

8 You can also manually select the access point by opening the Manual Connection page. Select the access point from the available list of detected wireless access points. Set the wireless authentication and encryption to match that of the access point device and click *OK*. If the access point is not displayed, click to *Search Again* to refresh the list.

Wireless	SSID Wireless Authentication Wireless Encryption		Buffalo-A-0D7A				
2.4 GHz			WPA2-PSK				
MAC Filtering			AES -				
Multicast Control	WPA-P	SK (Pre-shared key):					
Wireless Bridge	Select AP to connect to.						
Applications	Select	SSID		Signal	Encryption	Wireless Mode	
Admin	0	7ED6D8A7126BD7042A3	EEB3148EA1003	Excellent	On	n/g/b	
Status	۲	Buffalo-A-0D7A		Excellent	On	ac	
	0	WAP-G		Weak	On	n/g/b	
	0	Buffalo-G-12	27A	Weak	On	n/g/b	

**9** Enable *Repeater* to automatically use the access point's SSID and security settings.

**10** Click *Apply* to save your changes.

The AirStation should now be connected as a repeater. You can disconnect the Ethernet cable and move the AirStation to another location that is within range of the access point. Other devices can now connect to the AirStation to use the Internet.

#### **Connecting Wireless Bridge Clients with MAC Filtering Enabled**

When MAC filtering is enabled on the AirStation, a wireless client cannot access the AirStation unless its MAC address is registered. However, if the wireless client is connected through a wireless bridge, you need to register the MAC addresses of both the client and the wireless bridge. Otherwise, the client will not be able to access the AirStation.

When a wireless client connects to the AirStation via the wireless bridge, the MAC address displayed from AirStation's Settings is different from the original MAC address. You can register both MAC addresses so the wireless client can both access the AirStation directly or through a wireless bridge while MAC filtering is enabled. See the example below for clarification.

#### **Connect to the AirStation Directly:**

#### Connect to the AirStation via the Wireless Bridge:

- (1) Detected MAC address: 02:24:A5:D5:01:06
- (2) Client's MAC address: 00:24:A5:D5:01:06

In Settings, the client's MAC address will have a different second digit than the original. Refer to the "Adding Devices" section for more information.

# **Required Devices**

- AirStation with Internet connection This tutorial uses WZR-900DHP as an example.
- Wireless bridge This tutorial uses WZR-900DHP as an example.
- PC with Ethernet port

We recommend downloading and installing AirStation Configuration Tool from the Buffalo website.

# **Configuration**

Configure each step by following the instructions below.

Step 1: Register wireless clients Step 2: Connect the wireless bridge to the AirStation Step 3: Register client MAC addresses through bridge Step 4: Configure roaming

#### **Step 1: Register Wireless Clients**

Unregistered devices will not be able to connect to the AirStation after MAC filtering is enabled.

- 1 If MAC filtering is enabled on the AirStation, disable it for now.
- **2** Connect all wireless clients to the AirStation.
- **3** Log in to AirStation's Settings.
- **4** Navigate to Advanced Settings Wireless MAC Filtering.
- **5** Click Edit Registration List.

Enforce MAC Filtering(11n/g/b)Image: EnableEnforce MAC Filtering(11n/a)Image: Enable

Registration List MAC Address Connection Status No registered MAC addresses.

**6** Click *Register* in "Connected Client's List", then add all MAC addresses to the list.

B4:07:F9:EF:38:41	B4:07:F9:EF:38:41 Register					
Refresh						

7 Click "Log out" button on the upper right.

#### Step 2: Connect the Wireless Bridge to the AirStation

**1** Press the mode button 3 times (once per a second) and wait for about a minute.

After a minute, confirm that the LEDs appear as below: Power/Diag LED: lit red Wireless LED: blinks orange Internet Access LED: off Router LED: off

Note: If the LEDs do not appear as above, press the mode button some times until the LEDs appear as above.

- **2** Change the PC's IP address to "192.168.11.xxx" (e.g. 192.168.11.135).
- **3** Connect the wireless bridge to the PC with an Ethernet cable.

**4** Open a web browser and enter "192.168.11.100".

**5** Enter "admin" for the username and "password" for the password, then click *Log In*.

Edit Registration List					

Click "Log out" button on the upper right.

#### **Step 4: Configure Roaming**

- **1** Run AirStation Configuration Tool from the PC and scan for all devices.
- 2 Select the wireless bridge and select "Change IP Address".
- **3** Select "Get IP Address from DHCP" and click "Next". You may be prompted for the wireless bridge's password as it is being configured.

		×
$\bigcirc$	📸 AirStation Configuration Tool	
	IP Address	
	Enter an IP address for the AirStation manually, or have it assigned by the DHCP server	
	Get TB address from DHCP (recommended)	
	Cettr address non brier (recommended)	
	O Use the following IP address	
	IP Address 192 . 168 . 11 . 1 @Configuration	
	Subpet Mask 255.255.0	
	This computer's IP address:	
	192.168.11.3 / 255.255.255.0 : Local Area Connection (Atheros AR8162/8166/8168	
	Click Nave to continue	
	Circk Next to containde.	
	Next	

- 4 After the wireless bridge's IP address is configured, open any web browser and log in to Settings.
- **5** Navigate to Advanced Settings Wireless Wireless Bridge.
- 6 Check "Use SSID and security settings from master" and click Apply. Wireless Bridge

## **Adding Devices**

To add additional wireless or wired clients to this environment, follow the steps below.

- 1 Verify the MAC address of the device you want to add. If the device is using a wired connection, you may skip step 2 and go to step 3.
- **2** Change the second digit of the MAC address according to the following.

0 -> 2 4 -> 6 8 -> A C -> E For example, if the original MAC address is "00:24:A5:D5:01:06", change it to "0**2**:24:A5:D5:01:06".

**3** Log in to the AirStation's Settings and navigate to *Wireless - MAC Filtering*. Register the client's MAC address. Use the new MAC address if the second digit had been changed.

#### Saving and Restoring Settings with a Backup File

Once you have finished configuring your AirStation to your needs, you can save the current configuration to a backup file. This file can be used to restore the AirStation's settings when needed. For example, the AirStation will initialize its settings after a hard reset. Instead of re-configuring the unit, simply use the backup file to restore its previous settings.

The backup file is not automatically updated when you make further AirStation configuration changes.

LAN Settings Management Wireless Back up settings Security Operation O Restore settings Applications Initialize AirStation Admin Use Password System Password Show password Syslog Settings Execute Reset / Reboot

You can access Save settings by navigating to the Admin - Reset/Reboot.

- 1 On the Reset/Reboot page, select Back up settings.
- 2 Check Use Password if you want to encrypt the backup file with a password. If you do, the system will ask for the password when restoring settings with the backup file. The password may include up to 8 single-byte alphanumeric characters and underscores (\_).
- 3 Click Execute. The Save As dialog appears.
- 4 Click OK.

Once the file has been saved to your system, do not rename the backup file. If needed, you can put the file into another folder.
# **Restoring Settings with a Backup File**

Restore settings can be found on the same tab.

LAN	Settings Management			
Wireless Security Applications	Operation	<ul> <li>Back up settings</li> <li>Restore settings</li> <li>Initialize AirStation</li> </ul>		
Admin	Backup File	C:\Users\John\as_setting. Browse		
System Syslog Settings	Password	Use Password		
Reset / Reboot				
Update Firmware	Execute			

**1** On the Reset/Reboot page, select *Restore settings*.

2 The Browse field appears. Click *Browse...* to locate the backup file on the system.

**3** Click *Execute*. The Restore dialog appears.

**4** Enter the password if prompted. The password will be the one set when the backup file was created.

Please wait as the saved settings are restored to the AirStation. When settings are restored, all values (e.g. IP address, wireless encryption key, login, etc.) are changed to the ones saved in the backup file.

**Note:** The AirStation will not be able to restore settings if the backup file was created with a different version of the AirStation firmware or a different product.

## **Replacing the AirStation**

If an AirStation is no longer functional, you can replace it with another unit of the same model and use a saved backup file to automatically populate settings on the new unit. The firmware on the new unit must be the same version as the old unit when the backup file was created. If need be, downgrade the current firmware version to the previous one before using the backup file.

#### **Setting Up WebAccess**

WebAccess is a cloud service provided by Buffalo that allows you to access your NAS remotely over the Internet. You can share content with everyone or with specified users. You can set up WebAccess through the settings page of your NAS, or enable the service on your AirStation.

If you have a BuffaloNAS.com account, you can use its login to use WebAccess. You can also use your DDNS hostname or an external IP address along with the port used for WebAccess.

#### WebAccess Settings

- 1 Make sure the NAS is connected and available, and that the AirStation is powered on and connected.
- **2** Open the AirStation's Settings page and navigate to Security UPnP.
- **3** Enable UPnP and click *Apply*.
- **4** Navigate to Applications Disk Management.
- **5** Click Setting Changes.
- **6** Check Access Restrictions and click Save.

#### Shared Folder Settings

Read and Write	-				
Read and Write		Read Only		No access

~	->	-	->		Ŧ
Access Restriction	IS				
	Read and Write	Read and Write	Read and Write Read Only  Control Cont	Read and Write Read Only  Control Cont	Read and Write Read Only No access

- 7 If you need to create a new user for WebAccess, create one on the Disk Management page, under Add User.
- 8 Click Applications > WebAccess.

Check "Enable" for WebAccess.

9

WebAccess	C Enable		
Language	English 💌		
HTTPS/SSL Encryption	Enable		
WebAccess External Port	Auto Port Number: 9000		
	Use BuffaloNAS.com registration 💌		
DNS Service Hostname	BuffaloNAS.com Name		
	BuffaloNAS.com Key		

**10** Leave the WebAccess External Port option to "Auto" so that UPnP will automatically configure a port for you.

- **11** Select the DNS Service Hostname used to access the service. If you have a BuffaloNAS.com account, select *Use BuffaloNAS.com Registration* and enter your BuffaloNAS.com username and password. You can also use an existing hostname, such as your dynamic DNS hostname.
- **12** Click *Apply* at the bottom of the page.

## **Connecting Wireless Devices Using AOSS**

You can use the physical AOSS button on your AirStation to easily connect wireless devices that support AOSS or WPS. Consult your wireless device's documentation for the location of its AOSS or WPS button.

If you already have a wireless network that was configured without using AOSS or WPS, connecting a new device with AOSS will change its settings, disconnecting any previously connected wireless devices.

# Pushbutton Method

Easily connect other wireless devices using the physical AOSS button.

- **1** Power on the AirStation.
- **2** Hold the physical AOSS button down for two seconds, then release it.
- **3** For the next 2 minutes, the AOSS LED will flash and the AirStation will automatically search for a nearby AOSS/WPS device. The AirStation will automatically return to normal if a device isn't found after 2 minutes.
- **4** Push the AOSS/WPS button on the wireless device. It should be automatically connected within 2 minutes.

You can repeat this for all AOSS/WPS devices you are attempt to connect with. If setup doesn't work, open the AirStation's Settings page and ensure that the AOSS physical button is enabled.

#### **Setting Up a VPN Server**

You can configure a PPTP (VPN) server with either a dynamic DNS hostname or a static IP address.

Currently the AirStation supports both DynDNS and TZO. If you have a DynDNS or TZO account, you can enter the login and hostname information under *Internet - Dynamic DNS*.

# **PPTP Settings on the AirStation**

Your computer should be directly connected to the AirStation.

**1** Open the AirStation's Settings page and navigate to *Internet - PPTP*.

#### 2 Enable PPTP Server.

PPTP Server	Enable		
Authentication Type	S-CHAPv2 (40/128-bit Encryption)		
Advanced Settings			
Server IP Address	Auto     Manual		
Client IP Address	Auto     Manual for up to 5 address(es)		
DNS Server IP Address	<ul> <li>LAN-side IP address of the AirStation</li> <li>Manual</li> <li>Do not notify</li> </ul>		
WINS Server IP Addres	SS		
MTU/MRU Value	1396		

3 Select the VPN authentication type. If you are unsure which one to use, leave it on the default selection.

4 You can leave the Client IP Address on Auto. If client computers are within a specific IP address range, click Manual and enter the range into the field.

- 5 If you have a WINS server on the network, you can enter its IP address into the field.
- **6** Leave the MTU value on its default setting.

#### **Editing Users**

You can create and edit users that will access your PPTP server.

2

Enter a username and password for a new user.

Back

Add New U	Jser		
Username			
Password	Show password

Add			

3 Select "Method of Acquiring IP Address".

#### 4 Click Add.

The user will appear under the PPTP User List section. You can click Edit to modify the user or click Delete to remove the entry.

#### **Using AirStations with 2Wire Residential Gateways**

AT&T Internet services (U-verse or ADSL) will often assign a 2Wire residential gateway device that serves as both the modem and the router. To add an AirStation to this network, it is best to add the unit as a client device. This way the AirStation will not conflict with the existing residential gateway settings such as the firewall or port forwarding.

If you would like to set the 2Wire access point as the client device, or you need more information on its settings, contact AT&T technical support.

#### How to Use QoS

QoS (quality of service) is a feature that allows the AirStation to prioritize traffic by type. QoS applies to both upstream and downstream data flow, and ensures consistent performance when using certain high-traffic applications, such as video streaming.

The higher the priority, the higher the allocated bandwidth will be. For example, if *Video* is selected, streaming video will be given the highest bandwidth priority.

# Setting a QoS Priority Policy

When setting a custom policy, select the type of traffic to be given the highest priority and lower the priority of other traffic types accordingly.

- 2 Navigate to Applications QoS.
- **3** Enable *Priority Control QoS*.

#### **Priority Control QoS Settings**

Priority Control QoS	Enable		
Optimize for	Video 💌		
Manual	Video :	Ultra Premium - High Bandwidth	•
	Conference :	Premium - Low Latency, Medium Bandwidth	•
	Gaming :	Premium - Low Latency, 320 Kbps Bandwidt	•
	Audio :	Above Average, 320 Kbps Bandwidth	•
	Browsing :	Standard, Best Availability	•
	Download :	Junk, Lowest Priority	-

	15.4	
IVIa	anual Entry	
#	Registered Name	Priority
	No custom QoS rules added.	
A	dd	
D	elete All	

**4** Choose an *Optimize for* selection.

Video: Prioritizes streaming video traffic.
Voice: Prioritizes voice chats and VoIP traffic.
Gaming: Prioritizes online gaming traffic.
Manual: Select this option to customize QoS priority for a selected operation.

**5** To set a manual policy, select the operation to be prioritized and lower the priority for others. For example, if you set Video as *Ultra Premium - High Bandwidth*, the bandwidth priority of other operations should be lowered accordingly.

Click Apply.

# <u>Manual Entry</u>

Click *Manual Entry* to open the manual entry page, where you can create custom QoS priority settings for individual applications.

- 1 Enter a name for the new manual entry.
- 2 Select a value from the dropdown menu to define the priority level for incoming packets.
- **3** Select a protocol for the application's incoming packets. For example, most VoIP and multimedia applications use UDP, while the Internet and emails use TCP.
- **4** Set the WAN-side server and port number under "Remote Settings".
- 5 If you need to use a specific port, most network applications and services will have their required protocols and ports listed in their documentation.
- 6 Enter the IP address or MAC address of the network device for QoS priority.
- 7 Click Add.

Once an entry has been saved, you can click *Edit* to change it or *Delete* to remove the entry. Click *Delete All* to remove all saved entries.

#### How to Configure TCP/IP

#### Windows 8

To configure TCP/IP in Windows 8, follow the procedure below.

- 1 Open Control Panel.
- **2** Click Network and Internet.
- **3** Click Network and Sharing Center.
- **4** Click *Change Adapter Settings* on the left side menu.
- **5** Right-click the network adapter, then click *Properties*.
- **6** If the User Account Control screen opens, click *Yes* or *Continue*.
- 7 Select "Internet Protocol Version 4 (TCP/IPv4)" then click Properties.

8 To have DHCP set your IP address settings automatically, check "Obtain an IP address automatically" and "Obtain DNS server address automatically". Alternately, you can configure the settings manually. Example: If the router's IP address is 192.168.11.1, IP address: 192.168.11.80 Subnet mask: 255.255.255.0 Default gateway: 192.168.11.1 Preferred DNS server: 192.168.11.1 Alternate DNS server: leave blank

## Windows 7

To configure TCP/IP in Windows 7, follow the procedure below.

- 1 Open Control Panel.
- **2** Click Network and Sharing Center.
- **3** Click *Change Adapter Settings* on the left side menu.
- **4** Right-click the network adapter, then click *Properties*.

<sup>9</sup> Click OK.

- 5 If the "User Account Control" screen opens, click Yes or Continue.
- **6** Select "Internet Protocol Version 4 (TCP/IPv4)" then click *Properties*.

7 To have DHCP set your IP address settings automatically, check "Obtain an IP address automatically" and "Obtain DNS server address automatically". Alternately, you can configure the settings manually. Example: If the router's IP address is 192.168.11.1, IP address: 192.168.11.80 Subnet mask: 255.255.255.0 Default gateway: 192.168.11.1 Preferred DNS server: 192.168.11.1 Alternate DNS server: leave blank

8 Click OK.

## Windows Vista

To configure TCP/IP in Windows Vista, follow the procedure below.

- 1 Open Control Panel.
- **2** Click Network and Sharing Center.
- **3** Click *Manage network connections* on the left side menu.
- 4 Right-click the network adapter, then click *Properties*.
- 5 If the "User Account Control" screen opens, click Yes or Continue.
- **6** Select "Internet Protocol Version 4 (TCP/IPv4)" then click *Properties*.

To have DHCP set your IP address settings automatically, check "Obtain an IP address automatically" and "Obtain DNS server address automatically".
 Alternately, you can configure the settings manually. Example:
 If the router's IP address is 192.168.11.1,
 IP address: 192.168.11.80
 Subnet mask: 255.255.255.0
 Default gateway: 192.168.11.1
 Preferred DNS server: 192.168.11.1
 Alternate DNS server: leave blank

0		
0	Click	OK.

# Windows XP

To configure TCP/IP in Windows XP, follow the procedure below.

- 1 Open Control Panel.
- **2** Double-click *Network*.
- **3** Right-click the network adapter, then click *Properties*.
- **4** Select "Internet Protocol (TCP/IP)" then click *Properties*.
- 5 To have DHCP set your IP address settings automatically, check "Obtain an IP address automatically" and "Obtain DNS server address automatically". Alternately, you can configure the settings manually. Example: If the router's IP address is 192.168.11.1, IP address: 192.168.11.80 Subnet mask: 255.255.255.0 Default gateway: 192.168.11.1 Preferred DNS server: 192.168.11.1 Alternate DNS server: leave blank

```
6 Click OK.
```

## Mac OS

To configure TCP/IP in Mac OS, follow the procedure below.

- 1 Click Apple menu > System Preferences....
- 2 Click Network.
- **3** Click the network adapter.
- To have DHCP set your IP address settings automatically, select "Using DHCP" in the "Configure IPv4" field. Alternately, you can configure the settings manually. Example: If the router's IP address is 192.168.11.1, IP address: 192.168.11.80 Subnet mask: 255.255.255.0 Router: 192.168.11.1 DNS server: 192.168.11.1
- **5** Click *Apply*.
