

## Newegg Guide to Microsoft Mice with Magnifier Feature

The rampant pace of technological development has pushed display resolutions to levels higher than ever before. A higher resolution allows users to view a greater amount of content on the same size screen, but at the penalty of smaller text and images. Nowadays content is getting so small that squinting is sometimes the only way a user can see content clearly without the help of a magnifying glass.

Here to help is Microsoft, who has added a useful new feature in their mouse product line, and it is aptly called the Magnifier. The Magnifier acts as an electronic magnifying glass onscreen; magnifying any text, image or area you select onscreen, so you can save yourself many a painful squint. The Magnifier feature works with most programs on your computer\*.

*\*The Magnifier is not compatible with Direct3D ® API in full screen mode, media players, OpenGL, and Layered Windows. If you are using Mac OS X, the Magnifier enlarges text and images on the entire screen.*

Here is the entire lineup of Microsoft mouse products with built-in Magnifier feature.

Wireless Laser
