## FCC STATEMENT

FC

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/ TV technician for help.

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions:

- 1) This device may not cause harmful interference.
- 2) This device must accept any interference received, including interference that may cause undesired operation.

Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

Note: The manufacturer is not responsible for any radio or tv interference caused by unauthorized modifications to this equipment. Such modifications could void the user's authority to operate the equipment.

## FCC RF Radiation Exposure Statement

This equipment complies with FCC RF radiation exposure limits set forth for an uncontrolled environment. This device and its antenna must not be co-located or operating in conjunction with any other antenna or transmitter.

"To comply with FCC RF exposure compliance requirements, this grant is applicable to only Mobile Configurations. The antennas used for this transmitter must be installed to provide a separation distance of at least 20 cm from all persons and must not be co-located or operating in conjunction with any other antenna or transmitter."

## **CE Mark Warning**

## €€1588

This is a class B product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

## **National Restrictions**

#### 2400.0-2483.5 MHz

Country	Restriction	Reason/remark		
Dulgaria		General authorization required for outdoor use and

Norway	Implemented	area within a radius of 20 km from the centre of		
		Ny-Ålesund		
Russian Federation		Only for indoor applications		

Note: Please don't use the product outdoors in France.

This device has been designed to operate with the antennas listed below which have a maximum gain of 3 dBi. Antennas not included in this list or having a gain greater than 3 dBi are strictly prohibited for use with this device. The required antenna impedance is 50 ohms.

To reduce potential radio interference to other users, the antenna type and its gain should be so chosen that the equivalent isotropically radiated power (e.i.r.p.) is not more than that permitted for successful communication.

#### **DECLARATION OF CONFORMITY**

For the following equipment:

Product Description: 300Mbps High Gain Wireless N USB Adapter

Model No.: TL-WN822N

Trademark: TP-LINK

We declare under our own responsibility that the above products satisfy all the technical regulations applicable to the product within the scope of Council Directives:

Directives 1999/5/EC

The above product is in conformity with the following standards or other normative documents:

## **Chapter 1 Product Overview**

#### 1.1 Package Contents

Please verify that all the package contents below are available.

- > One TL-WN822N 300Mbps High Gain Wireless N USB Adapter
- > Quick Installation Guide
- > USB cable
- > One resource CD for TL-WN822N, including:
  - TP-LINK Wireless Configuration Utility (TWCU) and Drivers
  - User Guide
  - Other helpful information

Make sure that the above items are contained in the package. If any of the above items are damaged or missing, please contact your distributor.

#### P Note:

The 'adapter' mentioned in this User Guide stands for TL-WN822N 300Mbps High Gain Wireless N USB Adapter without any explanations.

#### 1.2 Introduction

The adapter is a 802.11n client device designed to deliver a high-speed and unrivaled wireless performance for your desktop. With a faster wireless connection, you can get a better Internet experience, such as downloading, gaming, video streaming.

With the 802.11n technology, higher throughput improvements using MIMO (multiple input, multiple output antennas), the TL-WN822N's auto-sensing capability allows high packet transfer rate of up to 300Mbps for maximum throughput. It has good capability on anti-jamming, and it can also interoperate with other wireless (802.11b) products. The adapter supports WEP, WPA and WPA2 encryption to prevent outside intrusion and protect your personal information from being exposed.

The adapter is easy to install and manage with the Quick Setup Wizard guiding you step-by-step through the installation process and the TP-LINK Wireless Configuration Utility instructing you to quickly set up a wireless connection.

With unmatched wireless performance, reception, and security protection, the TL-WN822N is the best choice for easily adding or upgrading wireless connectivity to your desktop.

#### 1.3 Features

- > Complies with IEEE802.11n, IEEE802.11g, IEEE802.11b standards
- Supports WPA/WPA2 data security, TKIP/AES encryption, WEP encryption
- Supports high rate of up to 300Mbps for maximum throughput, supports automatically adjust to lower speeds due to distance or other operating limitations
- Provides USB 2.0 interface
- Supports Ad-Hoc and Infrastructure modes
- Good capability on anti-jamming
- > Supports roaming between access points when configured in Infrastructure mode
- > Ease to configure and provides monitoring information
- Supports Windows 7, Windows Vista, and Windows XP
- Provides two antennas which are listed in a format of 2x2 for two receivers and two transmitters.

#### 1.4 Hardware Overview

LED status:

Status	Status Working Status	
On	The driver has not been installed.	
Flashing Slowly	The driver has been installed but no data is being transmitted or received.	
Flashing Quickly	Data is being transmitted or received.	

#### Note:

When the adapter failed to connect to a wireless network, the LED may be off. Please choose your network and try to connect again.

## **Chapter 2 Installation**

Please install the USB adapter into your computer before installing the driver software from the resource CD.

#### 2.1 Hardware Installation

- 1. Locate an available USB interface on your computer.
- 2. Connect the adapter and your computer with the USB cable contained in the package.

When the Found New Hardware wizard appears, click Cancel.

#### 2.2 Software Installation

The adapter's Setup Wizard will guide you through the installation procedures for Windows 7, Windows Vista, and Windows XP. The procedures in different systems are quite similar, therefore here takes the procedures in Windows 7 for example.

 Insert the Resource CD into your CD-ROM drive, and the window below will appear. Select model TL-WN822N. There will be a menu including: Install Driver&Utility and User Guide. Click Install Driver&Utility to begin.

Figure 2-1

2. The InstallShield Wizard window will appear. Click Next to continue.

Figure 2-2

3. Choose a setup type. It is recommended to select **Install TP-LINK Wireless Configuration Utility and Driver**. Selecting **Install Driver Only** will only install driver. Click **Next** to continue.

Figure 2-8

## **Chapter 3** Connect to a Wireless Network

With both the hardware and software successfully installed into your computer, you can quickly connect to a wireless network using one of the following methods.

Method One:

#### To connect using TWCU

TL-WN822N uses the TP-LINK Wireless Configuration Utility as the management software. The utility provides you an easy interface to connect to a network and to change any settings related to the wireless adapter.

Method Two:

#### To connect using QSS

Just by pushing the button, you can set up a wireless connection quickly under the condition that your router or access point supports QSS or WPS as is called by some other brands.

Method Three:

#### To connect using Windows built-in wireless utility

Windows users may use the built-in wireless utility to connect to a wireless network. For specific operations, please go to <u>3.3. connect using Windows built-in wireless utility</u>.

#### 3.1 To connect using TWCU

1. After installation, the utility configuration page will automatically pop up on the screen. If the utility page does not pop up, you can launch the utility by double-clicking on the 🖉 icon on your desktop.

	<				-	- ×

#### Figure 3-1

The Network page will display all wireless networks that are available in your area. To connect to a network, simply highlight the wireless network name and click Connect.
 SSID (Service Set Identifier) is the name of the wireless network. The adapter will

automatically connect to your target network next time if you tick Connect automatically.

Status	QSS	00 Network	Profile	Advanced

TP-LINK_C79AB5		AES/TKIP		6	and they
TP-LINK_C4	BC48	Nor	e	7	

Figure 3-2

3. If word **None** appears behind the SSID, this means the network to be connected is not security-enabled and you can connect to the network without entering a key. To prevent outside intrusion and safeguard your network, it is strongly recommended that you set a password to your router or access point.

TP-LIN					
Status	QSS	Network	Profile	Advanced

TP-LINK_5	A1B68	Non	e	6	al 🗸
					Rescan

#### Figure 3-3

If there is a "lock" icon behind the SSID, this means the wireless network is secure and the corresponding security type will display. You must know the encryption key/security settings to connect.

Input the password which can be found on the configuration page of your router or access point, then click **OK** to continue. Or push the QSS/WPS button on your router if your router features the QSS/WPS function to quickly build a connection without having to enter a key.

Please input the pa	assword:
Security Key:	****
	Show characters
()	You can also connect by pushing the button on the router.
	OK Cancel

Figure 3-4

4. You have now successfully connected to your network. Click **Close** to enjoy the Internet.

Figure 3-6

#### 3.2 To connect using QSS

QSS (Quick Secure Setup) function allows you to add a new wireless device to an existing network quickly.

If the wireless router supports QSS or Wi-Fi Protected Setup (WPS), you can establish a wireless connection between wireless card and router using either Push Button Configuration (PBC) method or PIN method. Three QSS connection methods are listed in the following parts while the third method is only supported in Windows XP and Windows Vista.

#### 3.2.1 PBC (Push Button Configuration) method

1. Press the QSS button on the back panel of the router. Here takes router TL-WR741ND for example.

- 2. Press the QSS button on the adapter. There are two ways:
  - Press and hold the QSS button on the adapter directly for 2~3 seconds until Figure 3-9 appears.

Figure 3-8
Configuring the wireless network.
Searching for an available network
Cancel

Figure 3-9

 Open TWCU and click QSS tab. Select Push the button on my access point or wireless router and then click Connect.

Figure 3-10

3. When the following window appears, you have successfully connected to the network.

Configuring the	wireless network.	
	(((QSS)))	
Successfully	prosted to the natwork by OSSI	
Successfully co	nnected to the network by QSS!	

Figure 3-11

#### 3.2.2 PIN method

There are two ways to configure the QSS by PIN method:

- 1) Enter the PIN from your AP device.
- 2) Enter a PIN into your AP device.

Following are detailed configuration procedures of each way.

#### 3.2.2.1. Enter the PIN from your AP device

 Open TWCU and click QSS tab. Select Enter the PIN of my access point or wireless router. In the empty field beside PIN, enter the PIN labeled on the bottom of the router (here takes 13492564 for example). If you have generated a new PIN code for your router, please enter the new one instead. Click Connect to continue.

Figure 3-12

2. The adapter will be connecting to the target network.

Figure 3-13

3. When Figure 3-11 appears, you have successfully connected to the network.

#### 3.2.2.2. Enter a PIN into your AP device

This method is available only in Windows XP and Windows Vista.

1. Open TWCU and click **QSS** tab. Select **Enter the PIN of this device into my access point or wireless router**. In the field beside PIN, you will see the PIN value of the adapter which is randomly generated. Click **Connect** to continue.

Figure 3-17

#### 3.3 To connect using Windows built-in wireless utility

#### 3.3.1 In Windows 7

Windows 7 users may use the built-in wireless utility. Follow the steps below.

1. Left-click the wireless icon in your system tray (lower-right corner) as shown in the figure below. The utility will display any available wireless networks in your area. Highlight the wireless network (displayed using the SSID) to be connected and then click **Connect**.

Figure 3-18

2. If the network you would like to connect is security-enabled, enter the same security key pr passphrase that is on your router. Or push the QSS button (other brands may call it WPS) on the router or access point (You will be prompted to push the button on the window if QSS function is supported as shown in the figure below). If the network to be connected is not secure, the connection will be built without entering a key.

## **Chapter 4 Management**

This section will show you how to configure your TL-WN822N adapter using the TP-LINK Wireless Configuration Utility (TWCU).

The TL-WN822N adapter uses the TP-LINK Wireless Configuration Utility as the management software. The utility provides users with an easy interface to change any settings related to the adapter. Double-clicking on the *management* icon on your desktop will start the utility.

#### 4.1 Profile

Your wireless networks may vary in different places like home, office or coffee shop. With **Profile** management, you can easily save and manage various networks to be connected, saving you the trouble of having to repeat the same configurations. Click **Profile** in the tools section, the following page will appear.

TP-LIN	к				-
Status	ass	<b>Network</b>	Profile	Advanced	
Profile Name	SSID		Network Type	Security	Connected

Figure 4-1

#### 4.1.1 Add a profile

To add a profile, click the **Add** button on the bottom of the screen. Then the configuration window will appear.

Profile Name:	Office

Security Key:	**********
Start this connec	tion automatically. Save Cancel

The following items can be found on the screen.

- Profile Name: Enter a name for your profile e.g. Home, Office, Coffee Shop). The same name is not allowed. Please also note that no space is allowed between words.
- > **SSID:** Select the target network from the drop-down list.
- Network Type: Select the network type. If you are connecting to a wireless router or access point, select Infrastructure. If you are connecting to another wireless client such as an adapter, select ad-hoc.
- Security Type: Select the security type from the list. Three options are available: WPA-PSK/WPA2-PSK, WEP and None. The security type should be the same as on your router or access point, otherwise, you will not be able to build a successful connection.

**WPA-PSK/WPA2-PSK** uses a passphrase or key to authenticate your wireless connection. The key must be the exact same key entered on your wireless router or access point. None stands for no security. It is recommended to enable WPA-PSK/WPA2-PSK on your wireless router or access point before configuring your wireless adapter.

- Encryption Type: From the drop-down menu, select the encryption type that is the same as on your router or access point.
- Security Key: Enter the passphrase exactly as it is on your wireless router or access point.
   Click the Show characters box to see the passphrase. Unchecking it will hide it.
- Start this connection automatically: check this box to automatically connect to this network next time.
- > **Save:** Click **Save** to save your settings.

Complete the above settings, the Profile page should looks like the following figure. To connect to a desired network, just highlight the network you would like to connect to and click the **Connect** button on the bottom of the window.

TL-WN822N 300Mbps High Gain Wireless N USB Adapter

TP-LIN	к				=
Status	QSS	Network	Profile	Advanced	
Profile Name	SSID		Network Type	Security	Connected
Home Office CoffeeShop	TP-LIN TP-LIN	IK_4B7EDA IK_Network1 IK_CB3A52	Infrastructure Infrastructure Infrastructure	None WPA-PSK/WPA None	No No No
		Add	Modify	Remove	Connect

Figure 4-3

#### 4.1.2 Modify a profile

You may edit an existing profile by clicking the **Modify** button from the Profile page. For instance, you may like to change the profile name from Home to Home1 or you may want to specify another SSID for profile Home. After all the changes, click **Save** to make the changes take effect.

Profile Name: SSID: Network Type: Security Type: Encryption Type:	Home1 TP-LINK_4B7EDA • Infrastructure © ad hoc None •
Start this connect	ction automatically.

Figure 4-4

#### 4.1.3 Delete a profile

To delete an existing profile, highlight the profile name and click **Remove** on the bottom of the screen or press the Delete button on your keyboard. When the following figure appears, click **OK** to continue.

Figure 4-5

#### 4.2 Advanced

The following configurations can be made on the **Advanced** page:

1) To select wireless configuration tool.

Here you can decide which tool to use, either the TP-LINK Configuration Utility or the Windows wireless configuration tool. This option is available only in Windows XP.

2) To switch to another wireless network adapter.

Here you can switch to another adapter installed in your computer. The adapters successfully installed in your computer will be listed in the drop-down menu if the adapters are supported by this utility.

3) To switch to SoftAP mode.

Once enabled, the adapter will be able to work as an AP.

4) To change the power save mode. The default option is **ON**.

Figure 4-6

#### 4.3 About

The About screen gives you information about the Driver and Utility versions of the adapter. Right-click on the adapter icon in your system tray and select **About** from the list.

TP-LINK Wirel	ess Configuration Utility				
UI version:	1.2.2 en.002

Figure 4-7

### Chapter 5 AP Mode

In Soft AP mode, the adapter will work as an AP. Suppose that only one computer in your house can access the Internet for various reasons like only one WLAN port is available on your wired broadband router, however, other wireless-capable devices also want to share the Internet. Then the adapter can be configured as an AP under the Soft AP mode, saving you the trouble of having to get a separate access point or a router.

With this feature, a computer can use a single physical wireless adapter to connect as a client to a hardware access point while at the same time acting as a software AP allowing other wireless-capable devices to connect to it.

To switch to this mode, right-click on the utility icon in your system tray and select **Switch to SoftAP mode**.

Figure 5-1

Or from the **Advanced** page of the utility, tick **ON** under the SoftAP mode as shown in the following figure. Click **OK** when prompted to confirm the setting.

	(QSS)		1		
Status	QSS	Network	Profile	Advanced	
	reless configurat TP-LINK Wireless	ion tool Configuration Utili	Are J	you sure to turn on ti	ae SoftAP

IP Address	c	192.168	.137.1			

Figure 5-3

- **SoftAP mode:** Select to enable or disable the function.
- Internet Connecting Share(ICS): Specify a connection through which devices connected to your AP can access the Internet. The system will automatically search for all the available connections in your computer and display them in the drop-down menu.
- SSID: Enter the name for your soft AP (for example, Jone) so that others can know which AP is yours when trying to connect to it. The default name (SSID) is "tp-link".
- Security Type: The security type here is set to be WPA2-PSK which is based on 802.11i and uses Advanced Encryption Standard instead of TKIP. It was designed to improve the security features of WEP. WPA2-PSK uses a passphrase or key to authenticate your wireless connection. You needn't make any configuration here.
- > **Encryption Type:** The encryption type here is set to be AES.
- Security Key: Enter the Key in the field to make your AP security enabled. It is recommended that you specify another key instead of the default key 12345678. Only by entering the corresponding key can other computers establish a successful connection with your AP.
- > **IP Address:** Here displays the IP address of the SoftAP.

## Chapter 6 Uninstall Software

#### 6.1 Uninstall the utility software from your PC

1. On the Windows taskbar, click the **Start** button, click **All programs**→**TP-LINK**, and then click **UninstalI-TP-LINK Wireless Configuration Utility**.

Figure 6-1

2. Follow the Install Shield Wizard to uninstall the utility software from your PC.

#### 6.2 Uninstall the driver software from your PC

1. On the Windows taskbar, click the **Start** button, and then click **All programs→TP-LINK**.

<ul> <li>Default Programs</li> <li>Desktop Gadget Gallery</li> <li>Internet Explorer</li> </ul>	
Windows DVD Maker Windows Fax and Scan Windows Media Center Windows Media Player Windows Update	english Documents Pictures
<ul> <li>XPS Viewer</li> <li>Accessories</li> <li>Games</li> <li>Maintenance</li> <li>Startup</li> <li>TP-LINK</li> </ul>	Music Games Computer
<ul> <li>TP-LINK Wireless Configuration Utility</li> <li>Uninstall - TL-WN822N Driver</li> <li>Uninstall - TP-LINK Wireless Configurat</li> <li>UltraISO</li> </ul>	Control Panel
Back  Search programs and files	Default Programs Help and Support Shut down

Figure 6-2 Device Manager

2. Click **Uninstall - TL-WN822N Driver** shown in above Figure 6-2, the system will uninstall the driver software of the adapter from your PC.

## **Appendix A: Specifications**

Normal	
Interface	USB 2.0 Interface
Standards	IEEE 802.11n, IEEE 802.11g, IEEE 802.11b
Operating System	Windows 7, Windows Vista, Windows XP
Throughput	300Mbps (Maximal)
	11b: 1/2/5.5/11Mbps
Radio Data Rate	11g: 6/9/12/18/24/36/48/54Mbps
	11n: Up to 300Mbps
	11b:CCK,QPSK,BPSK
Modulation	11g:OFDM
	11n: QPSK,BPSK,16-QAM,64-QAM
Media Access Protocol	CSMA/CA with ACK
Data Security	WPA/WPA2, WEP, TKIP/AES
Frequency*	2.4 ~ 2.4835GHz
Spread Spectrum	Direct Sequence Spread Spectrum (DSSS)
Safety & Emissions	FCC, CE

Environmental and Physical	
Working Temperature	0℃~40℃ (32°F~104°F)
Working Humidity	10% ~ 90% RH, Non-condensing
Storage Temperature	-40℃~70℃(-40°F~158°F)
Storage Humidity	5% ~ 90% RH, Non-condensing

\* Only 2.412GHz $\sim$ 2.462GHz is allowed to be used in USA, which means only channel 1 $\sim$ 11 is available for American users to choose.

## **Appendix B: Glossary**

- 802.11b The 802.11b standard specifies a wireless product networking at 11 Mbps using direct-sequence spread-spectrum (DSSS) technology and operating in the unlicensed radio spectrum at 2.4GHz, and WEP encryption for security. 802.11b networks are also referred to as Wi-Fi networks.
- 802.11g specification for wireless networking at 54 Mbps using direct-sequence spread-spectrum (DSSS) technology, using OFDM modulation and operating in the unlicensed radio spectrum at 2.4GHz, and backward compatibility with IEEE 802.11b devices, and WEP encryption for security.
- 802.11n 802.11n builds upon previous 802.11 standards by adding MIMO (multiple-input multiple-output). MIMO uses multiple transmitter and receiver antennas to allow for increased data throughput via spatial multiplexing and increased range by exploiting the spatial diversity, perhaps through coding schemes like Alamouti coding. The Enhanced Wireless Consortium (EWC) was formed to help accelerate the IEEE 802.11n development process and promote a technology specification for interoperability of next-generation wireless local area networking (WLAN) products.
- Ad hoc Network An ad hoc network is a group of computers, each with a Wireless Adapter, connected as an independent 802.11 wireless LAN. Ad hoc wireless computers operate on a peer-to-peer basis, communicating directly with each other without the use of an access point. Ad hoc mode is also referred to as an Independent Basic Service Set (IBSS) or as peer-to-peer mode, and is useful at a departmental scale or SOHO operation.
- DSSS (Direct-Sequence Spread Spectrum) DSSS generates a redundant bit pattern for all data transmitted. This bit pattern is called a chip (or chipping code). Even if one or more bits in the chip are damaged during transmission, statistical techniques embedded in the receiver can recover the original data without the need of retransmission. To an unintended receiver, DSSS appears as low power wideband noise and is rejected (ignored) by most narrowband receivers. However, to an intended receiver (i.e. another wireless LAN endpoint), the DSSS signal is recognized as the only valid signal, and interference is inherently rejected (ignored).
- FHSS (Frequency Hopping Spread Spectrum) FHSS continuously changes (hops) the carrier frequency of a conventional carrier several times per second according to a pseudo-random set of channels. Because a fixed frequency is not used, and only the transmitter and receiver know the hop patterns, interception of FHSS is extremely difficult.
- Infrastructure Network An infrastructure network is a group of computers or other devices, each with a Wireless Adapter, connected as an 802.11 wireless LAN. In infrastructure mode, the wireless devices communicate with each other and to a wired network by first going through an access point. An infrastructure wireless network connected to a wired network is referred to as a Basic Service Set (BSS). A set of two or more BSS in a single network is referred to as an Extended Service Set (ESS). Infrastructure mode is useful at a corporation scale, or when it is necessary to connect the wired and wireless networks.

- Spread Spectrum Spread Spectrum technology is a wideband radio frequency technique developed by the military for use in reliable, secure, mission-critical communications systems. It is designed to trade off bandwidth efficiency for reliability, integrity, and security. In other words, more bandwidth is consumed than in the case of narrowband transmission, but the trade off produces a signal that is, in effect, louder and thus easier to detect, provided that the receiver knows the parameters of the spread-spectrum signal being broadcast. If a receiver is not tuned to the right frequency, a spread-spectrum signal looks like background noise. There are two main alternatives, Direct Sequence Spread Spectrum (DSSS) and Frequency Hopping Spread Spectrum (FHSS).
- SSID A Service Set Identification is a thirty-two character (maximum) alphanumeric key identifying a wireless local area network. For the wireless devices in a network to communicate with each other, all devices must be configured with the same SSID. This is typically the configuration parameter for a wireless PC card. It corresponds to the ESSID in the wireless Access Point and to the wireless network name. See also Wireless Network Name and ESSID.
- WEP (Wired Equivalent Privacy) A data privacy mechanism based on a 64-bit or 128-bit or 152-bit shared key algorithm, as described in the IEEE 802.11 standard. To gain access to a WEP network, you must know the key. The key is a string of characters that you create. When using WEP, you must determine the level of encryption. The type of encryption determines the key length. 128-bit encryption requires a longer key than 64-bit encryption. Keys are defined by entering in a string in HEX (hexadecimal using characters 0-9, A-F) or ASCII (American Standard Code for Information Interchange alphanumeric characters) format. ASCII format is provided so you can enter a string that is easier to remember. The ASCII string is converted to HEX for use over the network. Four keys can be defined so that you can change keys easily.
- Wi-Fi A trade name for the 802.11b wireless networking standard, given by the Wireless Ethernet Compatibility Alliance (WECA, see http://www.wi-fi.net), an industry standards group promoting interoperability among 802.11b devices.
- WLAN (Wireless Local Area Network) A group of computers and associated devices communicate with each other wirelessly, which network serving users are limited in a local area.
- WPA (Wi-Fi Protected Access) A wireless security protocol uses TKIP (Temporal Key Integrity Protocol) encryption, which can be used in conjunction with a RADIUS server.
