CS1708i Rear

CS1716i Rear

Overview

The CS1708i and CS1716i KVM switches are IP based devices that allow either a local or remote operator to monitor and control 8 / 16 directly attached servers, or through daisy chaining up to 128 / 256 computers.

The IP console is accessed via a browser and control of the servers is accomplished via either a Java or Windows, based client. This arrangement allows you to connect to the unit from anywhere on your LAN, WAN or Internet [with a high speed connection] permitting you to work on your servers to the same degree as being in the server room, up and including BIOS adjustments.

The KVM features a panel array mode where you can selectively monitor servers simultaneously in a grid array, simply clicking on one of the images instantly brings that server to focus.

Security features include two level user name and password protection. Users can be assigned port-by-port access rights. 128 bit SSL encryption for the browser, and RC4 128 bit encryption for secure keyboard, mouse, and video data transmission. The CS1716i also supports authentication and authorization via remote servers, such as RADIUS, LDAP, LDAPS, and MS Active Directory.
